

Sammanfattning

Rapporten innehåller resultat från två utsjöresor i november. Egentliga Östersjön undersöktes i början av månaden, Västkusten och sydvästra Östersjön i slutet.

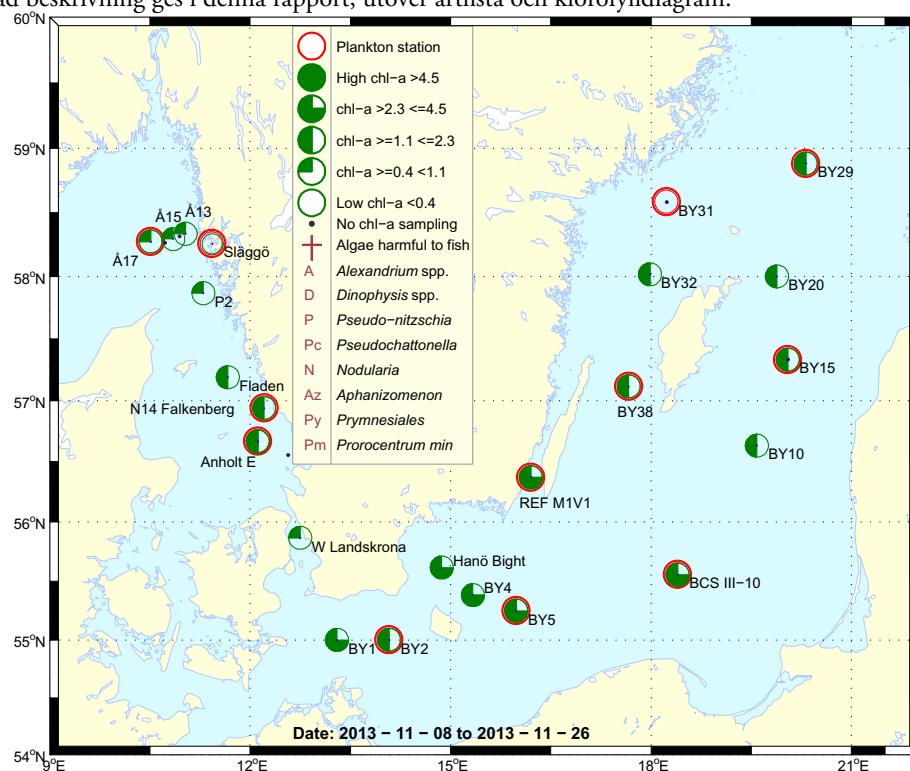

Artantal och cellantal var låga i Skagerrak. I Kattegatt var artdiversiteten ganska hög även om cellantalen var relativt låga. Det för fisk skadliga släktet *Pseudochattonella** observerades vid Släggö i Skagerrak och vid Anholt E i Kattegatt. Ett prov från klorofyllfluorescensmaximum på 5 meter vid Anholt E domineras av *Ceratium lineatum*, *Pseudo-nitzschia* spp* och *Dictyocha speculum*.

De integrerade klorofyll *a*-värdena låg omkring medel vid samtliga stationer.

Kiselalgläktet *Coscinodiscus* var vanligt förekommande vid nästan alla Östersjöstationer. I övrigt dominerade små flagellater och piko-cyanobakteriekolonier. Den potentiellt skadliga arten cf. *Prymnesium polylepis** fanns vid BY2, REF M1V1 och vid BY29.

Klorofyll *a*-värdena var något förhöjda i södra Östersjön, vid BY5 och REF M1V1 låg de integrerade värdena över medel för denna månad.

Ingen mer detaljerad beskrivning ges i denna rapport, utöver artlista och klorofylldiagram.

Abstract

This report presents the results from two November cruises. The Baltic Proper was visited in the beginning of the month, and the Skagerrak, the Kattegat and Southwestern Baltic areas in the end.

The number of species and cell numbers were low in the Skagerrak area. In the Kattegat the species diversity was rather high although the cell numbers were low. A genus harmful for fish, *Pseudochattonella**, was observed at the Skagerrak station Släggö and the Kattegat station Anholt E. A sample from a chlorophyll fluorescence maximum at 5 meters depth at Anholt E was dominated by *Ceratium lineatum*, *Pseudo-nitzschia* spp* and *Dictyocha speculum*.

The integrated chlorophyll *a* concentrations were approximately at average at all stations.

The diatom genus *Coscinodiscus* was common in the Baltic samples. Small flagellated species and pico cyanobacteria colonies dominated at the Baltic stations. The potentially harmful species cf. *Prymnesium polylepis** was observed at BY2, REF M1V1 and at BY29.

The chlorophyll *a* concentrations were somewhat high in the Southern Baltic, at stations BY5 and REF M1V1 the integrated concentrations were above average for this month.

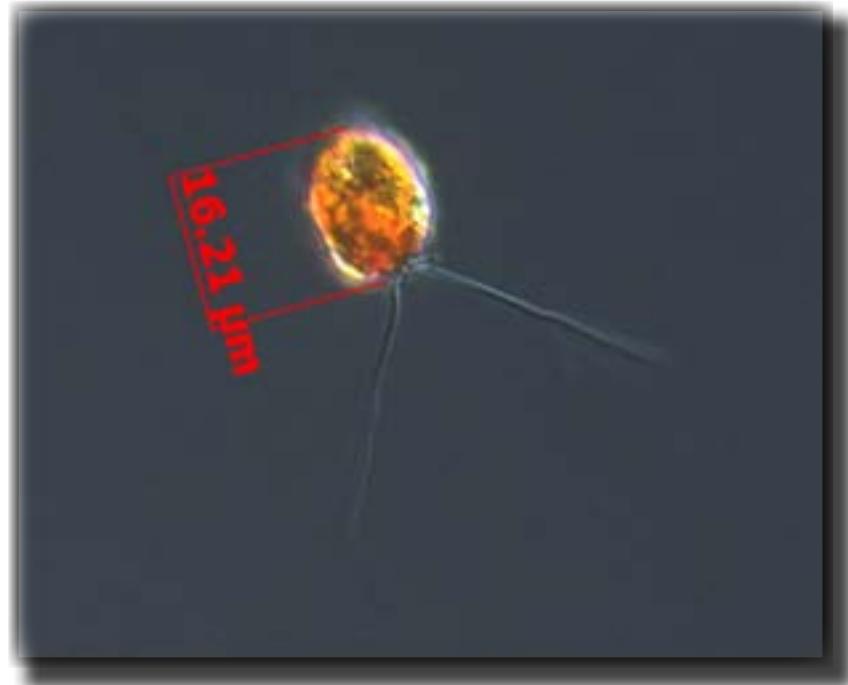

No further detailed information will be presented in this report, only a species list and chlorophyll diagrams.

The flagellate *Pseudochattonella* spp is harmful for fish. The genus was observed at Anholt E and at Släggö.

The diatom *Rhizosolenia hebetata* was common at Anholt E.

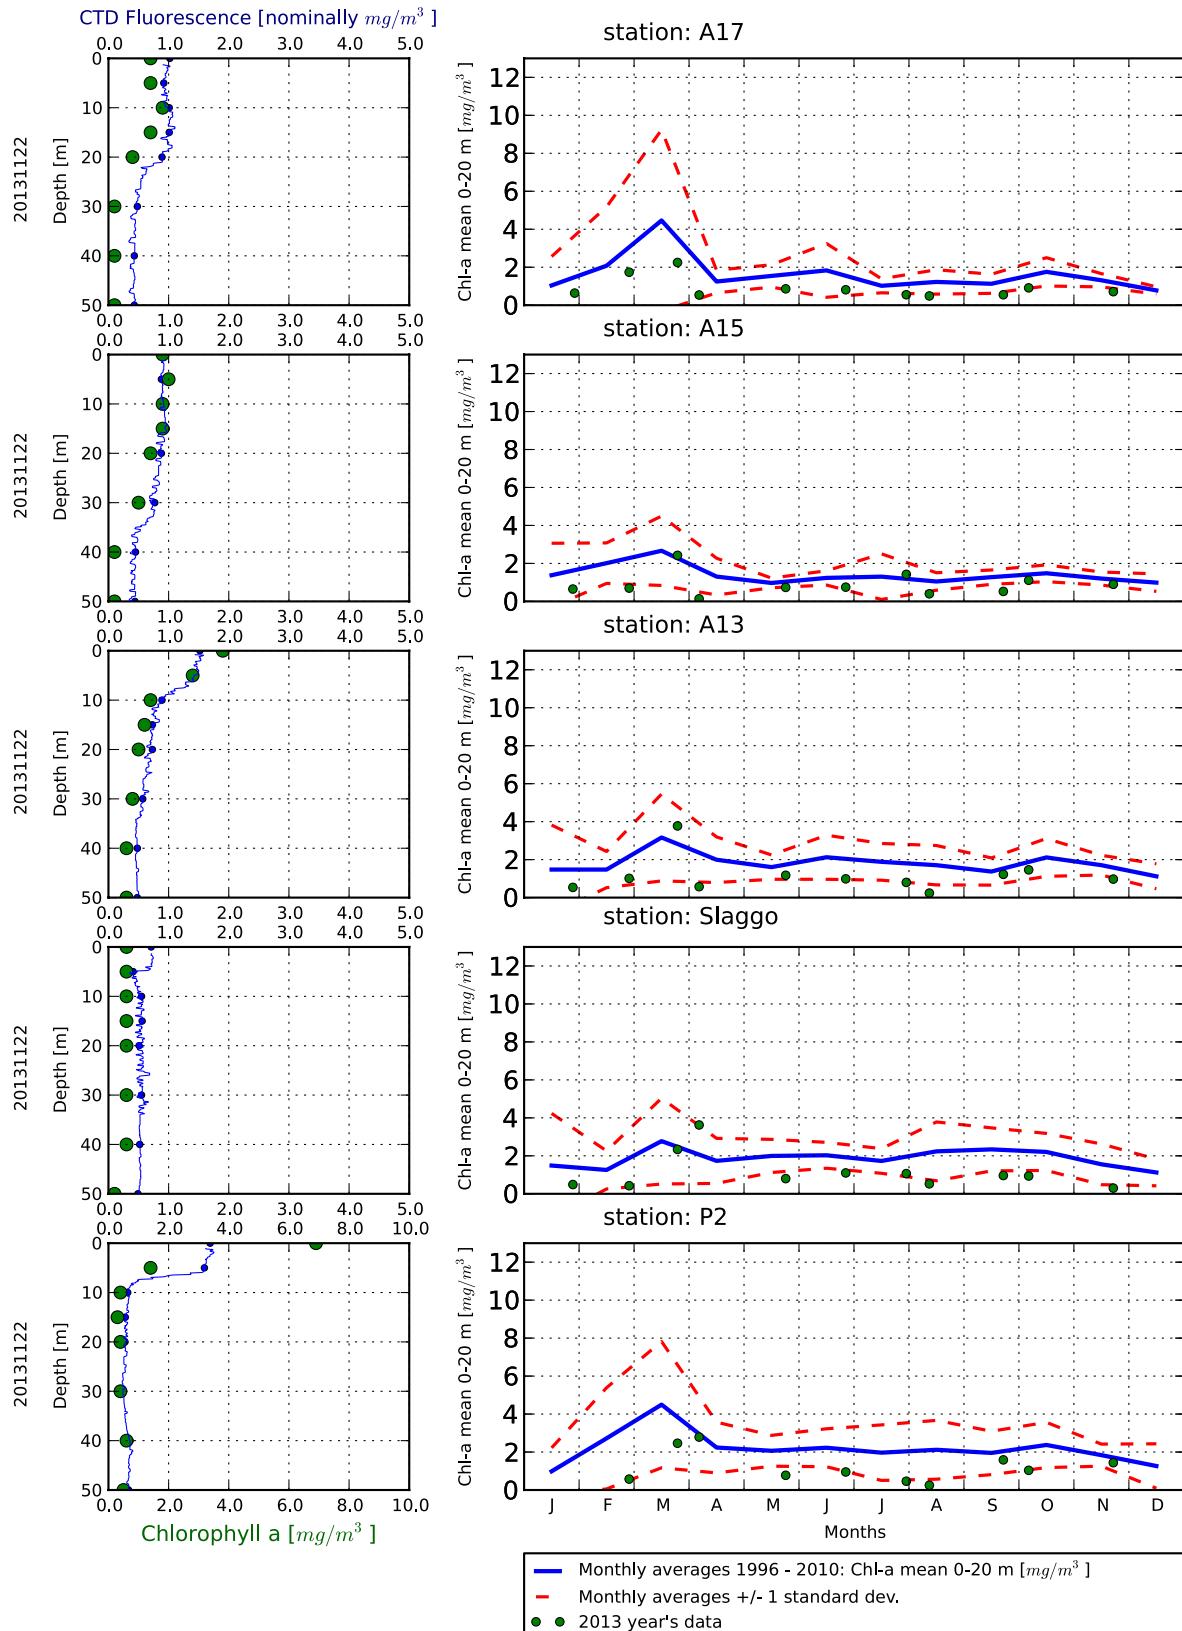

The potentially harmful flagellate *Prymnesium polylepis* was found at the Baltic stations BY2, BY29 and REF M1V1.

The Western Baltic

Om klorofylldiagrammen

Klorofyll *a* är ett mått på mängden växtplankton. Prover tas från ett antal djup. Data presenteras både från de fasta djuren och som medelvärdet 0-20 m. Utöver resultaten från laboratorieanalyserna av vattenprover mäts klorofyll *a* som fluorescens från ett automatiskt instrument som sänks ned från fartyget. På så sätt kan djupt liggande, ibland tunna lager av växtplankton observeras.

About the chlorophyll graphs

Chlorophyll *a* is sampled from several depths. Data are presented both from the discrete depths and as an average 0-20 m. In addition to the laboratory analysis from the water samples chlorophyll fluorescence is measured in continuous depth profiles from the ship. This is a way to observe thin layers of phytoplankton occurring below the surface.

Om AlgAware

SMHI genomför månatliga expeditioner i Östersjön och Västerhavet. Resultat baserade på semikvantitativ mikroskopanalys av planktonprover samt klorofyllmätningar presenteras kortfattat i denna rapport. Information från SMHIs satellitövervakning av algbloomingar finns under perioden juni-augusti på www.smhi.se.

About AlgAware

SMHI carries out monthly cruises in the Baltic and the Kattegat/Skagerrak. Results from semi quantitative microscopic analysis of phytoplankton samples as well as chlorophyll measurements are presented in brief in this report. Information from SMHIs satellite monitoring of algal blooms is found on www.smhi.se during the period June-August.

Art / Species	Gift / Toxin	Eventuella symptom	Clinical symptoms
<i>Alexandrium</i> spp.	Paralytic shellfish poisoning (PSP)	Milda symptom: Inom 30 min.: Stickningar eller en känsa av bedövning runt läpparna, som sprids gradvis till ansiktet och nacken; stickningar i fingertoppar och tår; Huvudvärk; yrsel, illamående, kräkningar, diarré Extrema symptom: Muskelförlamning; andningssvårigheter; känsa av att kvävas; Man kan vara död inom 2-24 timmar efter att ha fått i sig giften, på grund av att andningsmuskulaturen förlamas.	Mild case: Within 30 min: tingling sensation or numbness around lips, gradually spreading to face and neck; prickly sensation in fingertips and toes; headache, dizziness, nausea, vomiting, diarrhoea. Extreme case: Muscular paralysis; pronounced respiratory difficulty; choking sensation; death through respiratory paralysis may occur within 2-24 hours after ingestion.
<i>Dinophysis</i> spp.	Diarrehetic shellfish poisoning (DSP)	Milda symptom: Efter cirka 30 minuter till några timmar: yrsel, illamående, kräkningar, diarré, magont Extrema symptom: Upprepad exponering kan orsaka cancer	Mild case: Within 30 min-a few hours: dizziness, nausea, vomiting, diarrhoea, abdominal pain. Extreme case: Repeated exposure may cause cancer.
<i>Pseudo-nitzschia</i> spp.	Amnesic shellfish poisoning (ASP)	Milda symptom: Efter 3-5 timmar: yrsel, illamående, kräkningar, diarré, magkramper Extrema symptom: Yrsel, hallucinationer, förvirring, förlust av korttidsminne, kramper	Mild case: Within 3-5 hours: dizziness, nausea, vomiting, diarrhoea, abdominal cramps. Extreme case: dizziness, hallucinations, confusion, loss of memory, cramps.
<i>Chaetoceros concavicornis/ C.convolutus</i>	Mechanical damage through hooks on setae	Låg celltäthet: Ingen påverkan. Hög celltäthet: Fiskens gälar skadas, fisken dör.	Low cell numbers: No effect on fish. High cell numbers: Fish death due to gill damage.
<i>Pseudochattonella</i> spp.	Fish toxin	Låg celltäthet: Ingen påverkan. Hög celltäthet: Fiskens gälar skadas, fisken dör.	Low cell numbers: No effect on fish. High cell numbers: Fish death due to gill damage.

Översikt över några potentiellt skadliga alger och det aktuella giftets effekt. Overview of potentially harmful algae and effects of toxins. Manual on harmful marine microalgae (2003 - UNESCO Publishing).

Kartan på framsidan visar viktat medelvärde för klorofyll α , $\mu\text{g/l}$ (0-20 m) vid de olika stationerna. Förekomst av skadliga alger vid stationer där arter analyseras markeras med symbol.

The map on the front page shows weighted mean of chlorophyll α , $\mu\text{g/l}$ (0-20 m) at sampling stations. Presence of harmful algae at stations where species analysis is performed is shown with a symbol.
