

Oceanografisk rapport från IBTS-Q1 med R/V Svea – januari 2026

Foto: Lena Viktorsson, SMHI

- Expeditionens varaktighet:** 2026-01-18 till 2026-02-01
- Uppdragsgivare:** Sveriges Meteorologiska och Hydrologiska Institut (SMHI),
Havs- och Vattenmyndigheten (HaV)
- Samarbetspartners:** Sveriges Lantbruksuniversitet (SLU), Sjöfartsverket
(SjöV), Umeå marina forskningscentrum vid Umeå
universitet (UMF)

SAMMANFATTNING

Vårblomningen av växtplankton hade börjat i både Skagerrak och Kattegatt vilket syntes både i form av minskade koncentrationer av nitrat i ytvattnet och klorofyllfluorescenstoppar ovanför termoklinen

I Skagerrak var ytvattentemperaturen låg och under det normala närmast den svenska kusten öster om Skagens spets, medan vattnet från Norra Nordsjön hade temperaturer över det normala. Salthalten följde samma mönster, med låga värden i kustnära områden och höga värden mot Nordsjön. I de kustnära områdena där ytvattnet kylts ned fanns en termoklin på ca 15–20 m. Koncentrationerna av fosfat och silikat i Skagerrak låg nära vintermaxima, men nitratkoncentrationerna längs den svenska kusten var lägre än normalt för månaden. Vid flera stationer i norra Skagerrak förekom också toppar i klorofyllfluorescens med hög planktonaktivitet på ca 10 m djup strax ovanför termoklinen. Någon syrebrist i bottenvattnet uppmättes inte.

I Kattegatt var ytvattentemperaturen under normal vid flera stationer, särskilt under expeditionens senare del, och salthalten i ytvattnet var lägre än normalt i de södra delarna. Det fanns ett språngskikt på ca 5 m djup, ovanför språngskiktet var det relativt mycket klorofyllfluorescens. Halterna av fosfat var normala medans halten av nitrat hade börjat minska och var under det normala. Den låga nitratkoncentrationen tillsammans med klorofyllfluorescensen i det översta lagret tyder på pågående eller nyligen påbörjad planktonproduktion, precis som i Skagerrak. Ingen syrebrist noterades i bottenvattnet, även om syrekoncentrationerna lokalt låg nära gränsen för syrebrist.

SUMMARY

The phytoplankton spring bloom had commenced in both the Skagerrak and the Kattegat, as indicated by declining nitrate concentrations in surface waters and by distinct chlorophyll fluorescence maxima above the thermocline.

In the Skagerrak, surface water temperatures were low and below the monthly mean in coastal areas east of the tip of Skagen towards the Southern North Sea, while waters originating from the Northern North Sea exhibited temperatures above normal. Salinity followed a similar pattern, with lower values in coastal areas and higher values toward the North Sea. In the coastal regions where surface waters had cooled, a thermocline was present at approximately 15–20 m depth. Phosphate and silicate concentrations were close to winter maxima throughout the Skagerrak, whereas nitrate concentrations along the Swedish coast were lower than normal for the month. At several stations in the northern Skagerrak, pronounced chlorophyll fluorescence maxima, indicating elevated plankton activity, were observed at depths of around 10 m, just above the thermocline. No oxygen deficiency was detected in bottom waters.

In the Kattegat, surface water temperatures were below normal at several stations, particularly during the latter part of the expedition, and surface salinity was lower than normal in the southern parts of the area. A shallow pycnocline was present at approximately 5 m depth, above which relatively high chlorophyll fluorescence was observed. Phosphate concentrations were within normal ranges, while nitrate concentrations had begun to decline and were below normal. The low nitrate concentrations, together with elevated chlorophyll fluorescence in the surface layer, indicate ongoing or recently initiated phytoplankton production, similar to conditions observed in the Skagerrak. No oxygen deficiency was observed in bottom waters, although oxygen concentrations were locally close to the threshold for oxygen deficiency.

EXPEDITIONSÖVERSIKT

Expeditionen genomfördes med forskningsfartyget R/V Svea och startade i Lysekil den 18 januari och avslutades i samma hamn den 2 februari. Vädret under expeditionen var blåsigt, kallt och mulet. Under den första delen besöktes Kattegatt då vädret på Skagerrak och Nordsjön var för dåligt för trålning och provtagning. Under den andra halvan av expeditionen besöktes Nordsjön och Skagerrak och tre stationer i Kattegatt som inte hunnit med under den första halvan.

Expeditionen IBTS-Q1 (International Bottom Trawl Survey) genomförs av SLU-Aqua¹ som en del i den internationellt koordinerade fiskeriövervakningen och SMHI utför kartering av näringsämnen i Skagerrak och Kattegatt. I samband med samtliga tråldrag togs en profil med en CTD² och vid alla utom fyra stationer togs även vattenprover. Varje dag togs två fulla profiler med vattenprover från samtliga standarddjup och vid ett av dessa två tillfällen per dag togs prover för pH och alkalinitet, utöver klorofyll, näringsämnen och syre. Vid övriga tråldrag togs vattenprover endast vid ytan (0, 5, 10 m) och vid botten (1–3 m ovan botten). Vid fyra av trålragen togs enbart CTD och inga vattenprover. Under expeditionen kunde två av SMHIs ordinarie stationer provtas, Anholt E och Fladen i Kattegatt. Vid Anholt E utfördes planktonprovtagning ifrån 0–10 m, men zooplankton kunde inte provtas då det blåste för mycket.

Sveas FerryBox kördes under hela expeditionen. Dagligen togs ett referensprov från FerryBoxen för klorofyllanalys.

Rapporten är baserad på data som genomgått en första kvalitetskontroll och som är jämförd mot månadsmedelvärde för perioden 1991–2020. När ytterligare kvalitetsgranskning genomförts kan vissa värden komma att ändras. Värden som anges i rapporten har avrundats till närmaste tiondel och kan därför skilja sig från publicerade värden. Data publiceras så fort som möjligt på datavärdens hemsida, normalt inom ca en vecka efter avslutad expedition. Vissa analyser utförs efter expeditionen och publiceras därför senare.

² CTD är ett profilerande mätinstrument och står för Conductivity, Temperature, Depth.

Skagerrak

Temperaturen i ytvattnet varierade mellan 0,5 och 8,7 °C. De lägsta temperaturerna uppmättes närmast kusten öster om Skagens spets, där ytvattentemperaturen varierade mellan 0,5 och 2,3 °C, vilket var under normalt för månaden. I detta område hade en termoklin bildats och vattenkolumnen var välblandad ned till cirka 10–15 m. Under termoklinen ökade temperaturen till omkring 8 °C. Väster om Skagen, ut mot Nordsjön, var ytvattnet varmare, 3,9–8,7 °C. De högsta temperaturerna uppmättes i vatten från Norra Nordsjön 7,6–8,7 °C vilket var över normalt. Vid stationerna norr om Hirtshals förekom en svag termoklin på cirka 5 m djup, medan vattenkolumnen vid stationerna längre västerut mot Nordsjön var välblandad från ytan till botten.

Salthalten i ytvattnet visade ett liknande mönster som temperaturen, med de lägsta salthalterna öster om Skagens spets (21,4–25,9) och successivt ökande salthalter ut mot Nordsjön, omkring 30 norr om Hirtshals och upp till cirka 35 längst västerut. Där termoklin förekom ökade salthalten till omkring 35 under detta skikt. Ingen syrebrist uppmättes i bottenvattnet, koncentrationen låg mellan 5,4 och 6,8 ml/l.

Koncentrationerna av lösta oorganiska näringsämnen var nära vintermaxima, men i vid stationerna längs svenska kusten observerades planktonaktivitet i form av klorofyllfluorescens, vid några stationer med toppar vid termoklinen, var koncentrationerna av näringsämnen lägre. Det var tydligast i koncentrationen av nitrat som också var lägre än normalt för månaden i det området.

Koncentrationen av fosfat varierade mellan 0,4–0,8 µmol/l i ytvattnet med lägre halter närmast kusten och högre ut mot Nordsjön. Tre stationer skiljde ut sig med koncentrationer runt 0,8 µmol/l, övriga varierade mellan 0,4–0,6 µmol/l. Koncentrationen av nitrat varierade mellan 1,0–10,2 µmol/l. De lägsta koncentrationerna uppmättes längs den svenska kusten (1,0–4,4 µmol/l), där även planktonaktivitet i form av klorofyllfluorescens observerades. Vid två stationer togs extra prover för växtplanktonanalys i klorofyllfluorescens toppar på ca 10 m djup, vilka sammanföll med termoklinen. Tre stationer uppvisade förhöjda nitratkoncentrationer runt 10 µmol/l; dessa var samma stationer som hade de högsta fosfatkoncentrationerna. Vid övriga stationer varierade nitratkoncentrationerna mellan 1,0 och 7,9 µmol/l. Koncentrationen av silikat varierade mellan 3,9–10,8 µmol/l. De högsta koncentrationerna uppmättes vid stationerna norr om Hirtshals nordost om Skagen. I övrigt var koncentrationerna längs den svenska kusten något högre (5,6–7,0 µmol/l) jämfört med stationerna längre ut mot Nordsjön (4,2–5,9 µmol/l).

Vid en station (19 W Måseskär) med en tydlig topp i klorofyllfluorescens togs ett extra vattenprov på 10 m för analys av växtplankton. Provet visade förekomst av de klassiska vårblomningsarterna *Skeletonema marinoi* och *Thalassiosira nordenskioeldii*, men även *Chaetoceros danicus* och den potentiellt giftiga *Pseudo-nitzschia sp.*

Kattegatt

I Kattegatt varierade temperaturen i ytvattnet mellan 1,8 och 4,0°C under expeditionens första vecka medan temperaturen hade sjunkit till mellan 0,6 och 1,2°C när tre stationer besöktes i havsområdet under expeditionens andra vecka. De lägre temperaturerna var under det normala för månaden. Salthalten i ytvattnet varierade mellan 15,1 och 25,4 och den var lägre än det normala vid de flesta stationer söder om Läsö. Vattnet var skiktat med en pyknoklin på runt 5 m djup, under den ökade temperatur och salthalt och under ca 20–30 m var salthalten mellan 33–35 och temperaturen mellan 7,2 och 9,5 grader. Ingen syrebrist uppmättes i bottenvattnet, den lägsta syrekoncentrationen uppmättes i Skälderviken, 4,3 ml/l, vilket är strax över gränsen för syrebrist.

Fosfatkoncentrationerna varierade mellan 0,4 och 0,7 µmol/l och var inom det normala vid samtliga stationer. Nitratkoncentrationerna var däremot lägre än normalt vid de flesta stationer och varierade mellan 1,0 och 4,1 µmol/l. Endast en station uppvisade en koncentration inom det normala intervallet (4,1 µmol/l), medan övriga stationer hade koncentrationer mellan 1,0 och 3,8 µmol/l. Koncentrationen av silikat varierade mellan 8,6 och 12,6 µmol/l. Halterna var inom det normala vid de flesta stationer, med undantag för det högsta uppmätta värdet på 12,6 µmol/l, som låg något över det normala.

Viss planktonaktivitet observerades i ytvattnet i form av klorofyllfluorescens, men utan tydliga fluorescenstoppar såsom de som observerades i Skagerrak. De generellt låga nitratkoncentrationerna i ytvattnet indikerar att växtplanktonproduktionen har inletts och att näringsämnen redan har börjat förbrukas i det övre vattenlagret. Vid stationen Fladen togs ett extra vattenprov på 10 m djup för analys av växtplankton, provet innehöll samma typiska vårblomningsarter som provet från Skagerrak, men artdiversiteten vid Fladen var lägre än i provet från Skagerrak.

Figurer

Figur 1. Koncentrationen ($\mu\text{mol/l}$) av oorganiskt kväve (DIN) i ytvattnet (0–10 m). Medelvärdet är baserat på aktuell månads data för respektive havsbassäng 1991–2020.

Figur 2. Koncentrationen ($\mu\text{mol/l}$) av fosfat i ytvattnet (0–10 m). Medelvärdet är baserat på aktuell månads data för respektive havsbassäng 1991–2020.

Vertical profiles NW SKÄGGA January

Statistics based on data from: Västkustens yttre kustvatten, Skagerrak

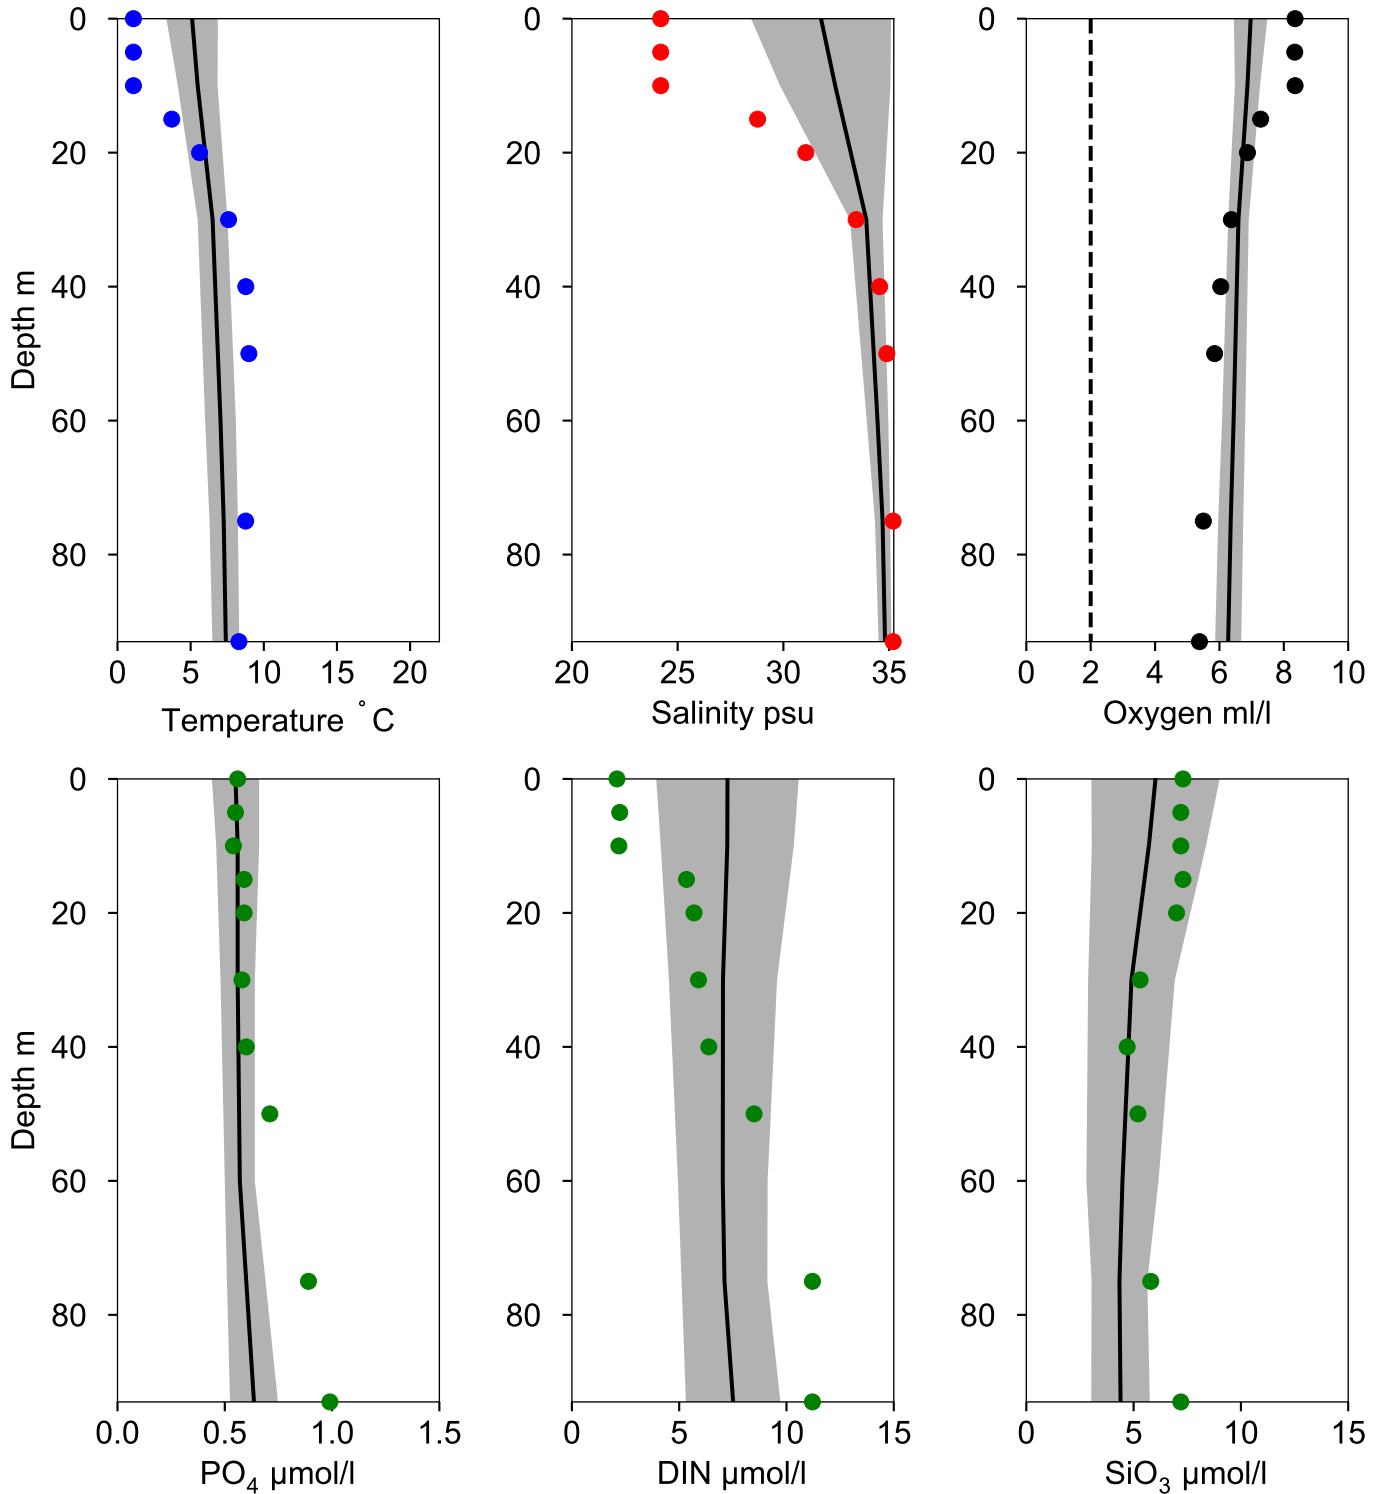

— Mean 1991-2020 ■ St.Dev. ● 2026-01-31

Vertical profiles 5 W VÄDERÖARNA January

Statistics based on data from: Skagerrak

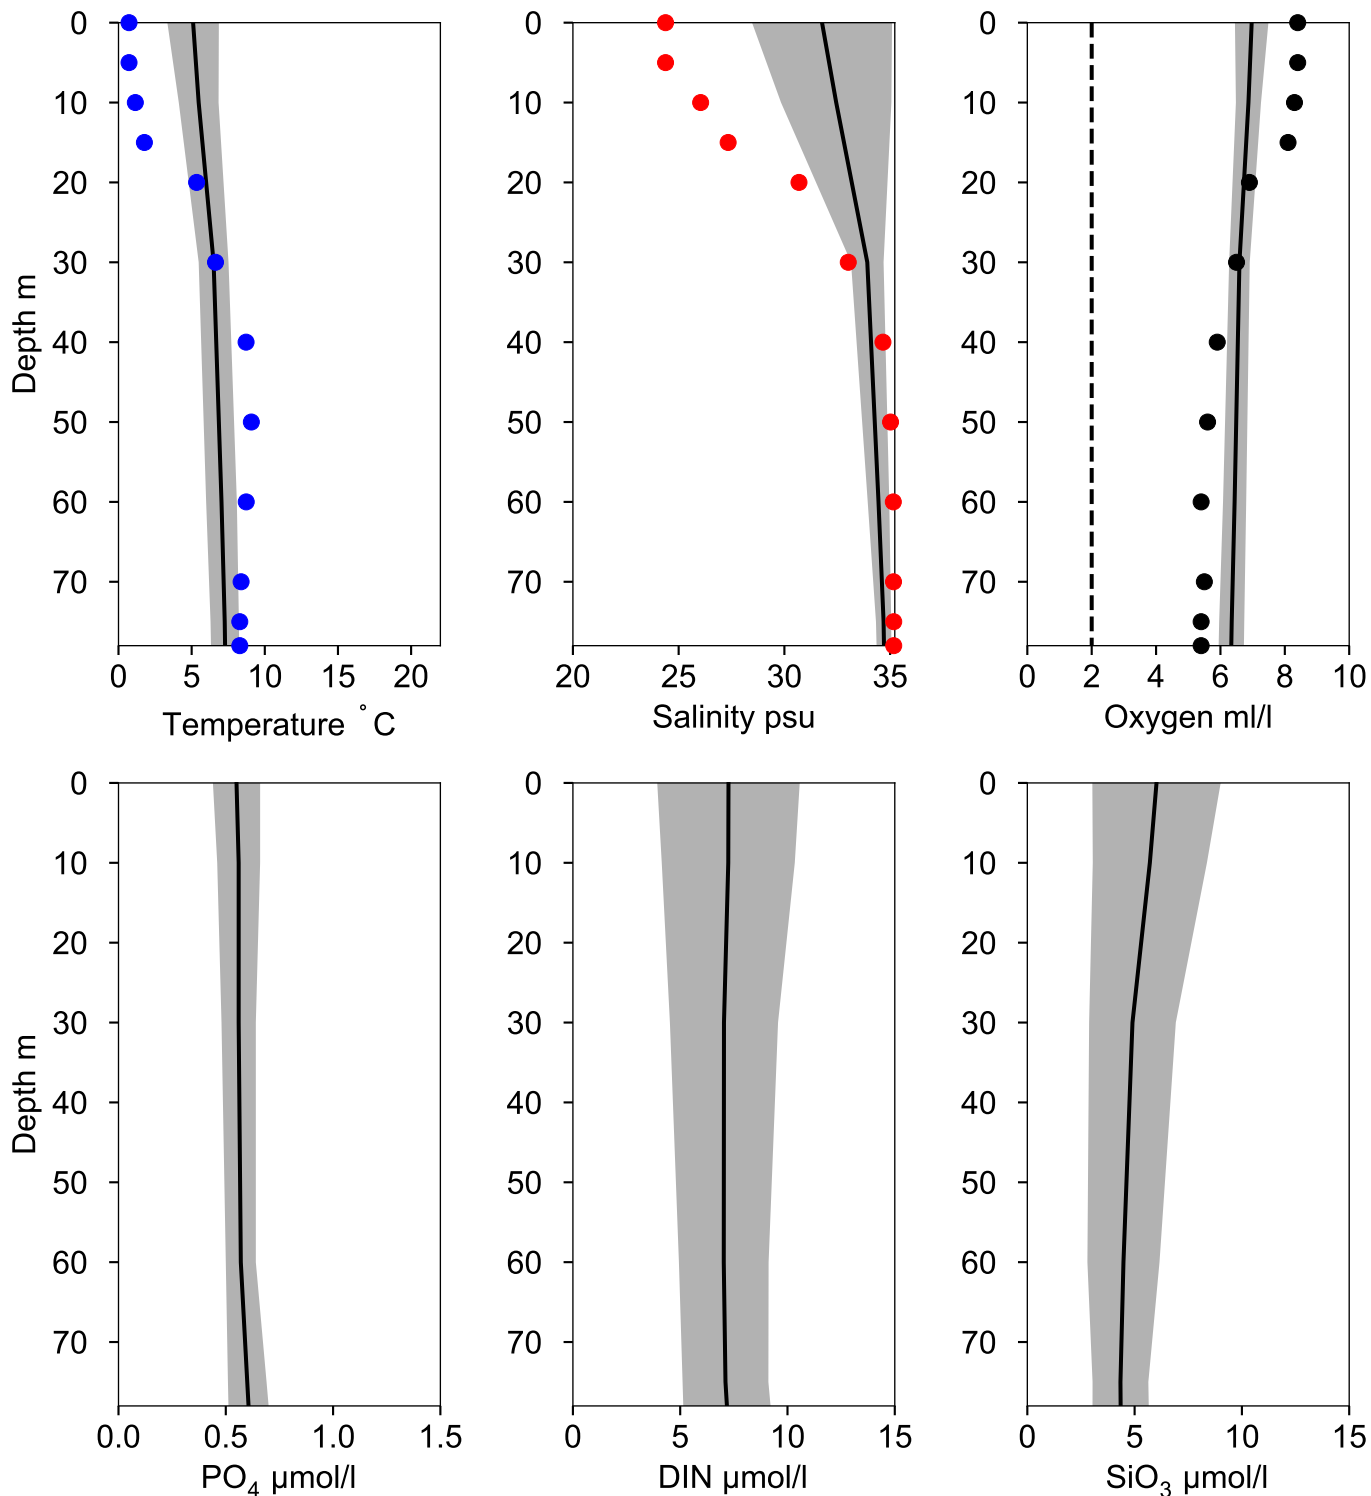

— Mean 1991-2020 St.Dev. ● 2026-01-31

Vertical profiles KILEBOJEN January

Statistics based on data from: Skagerrak

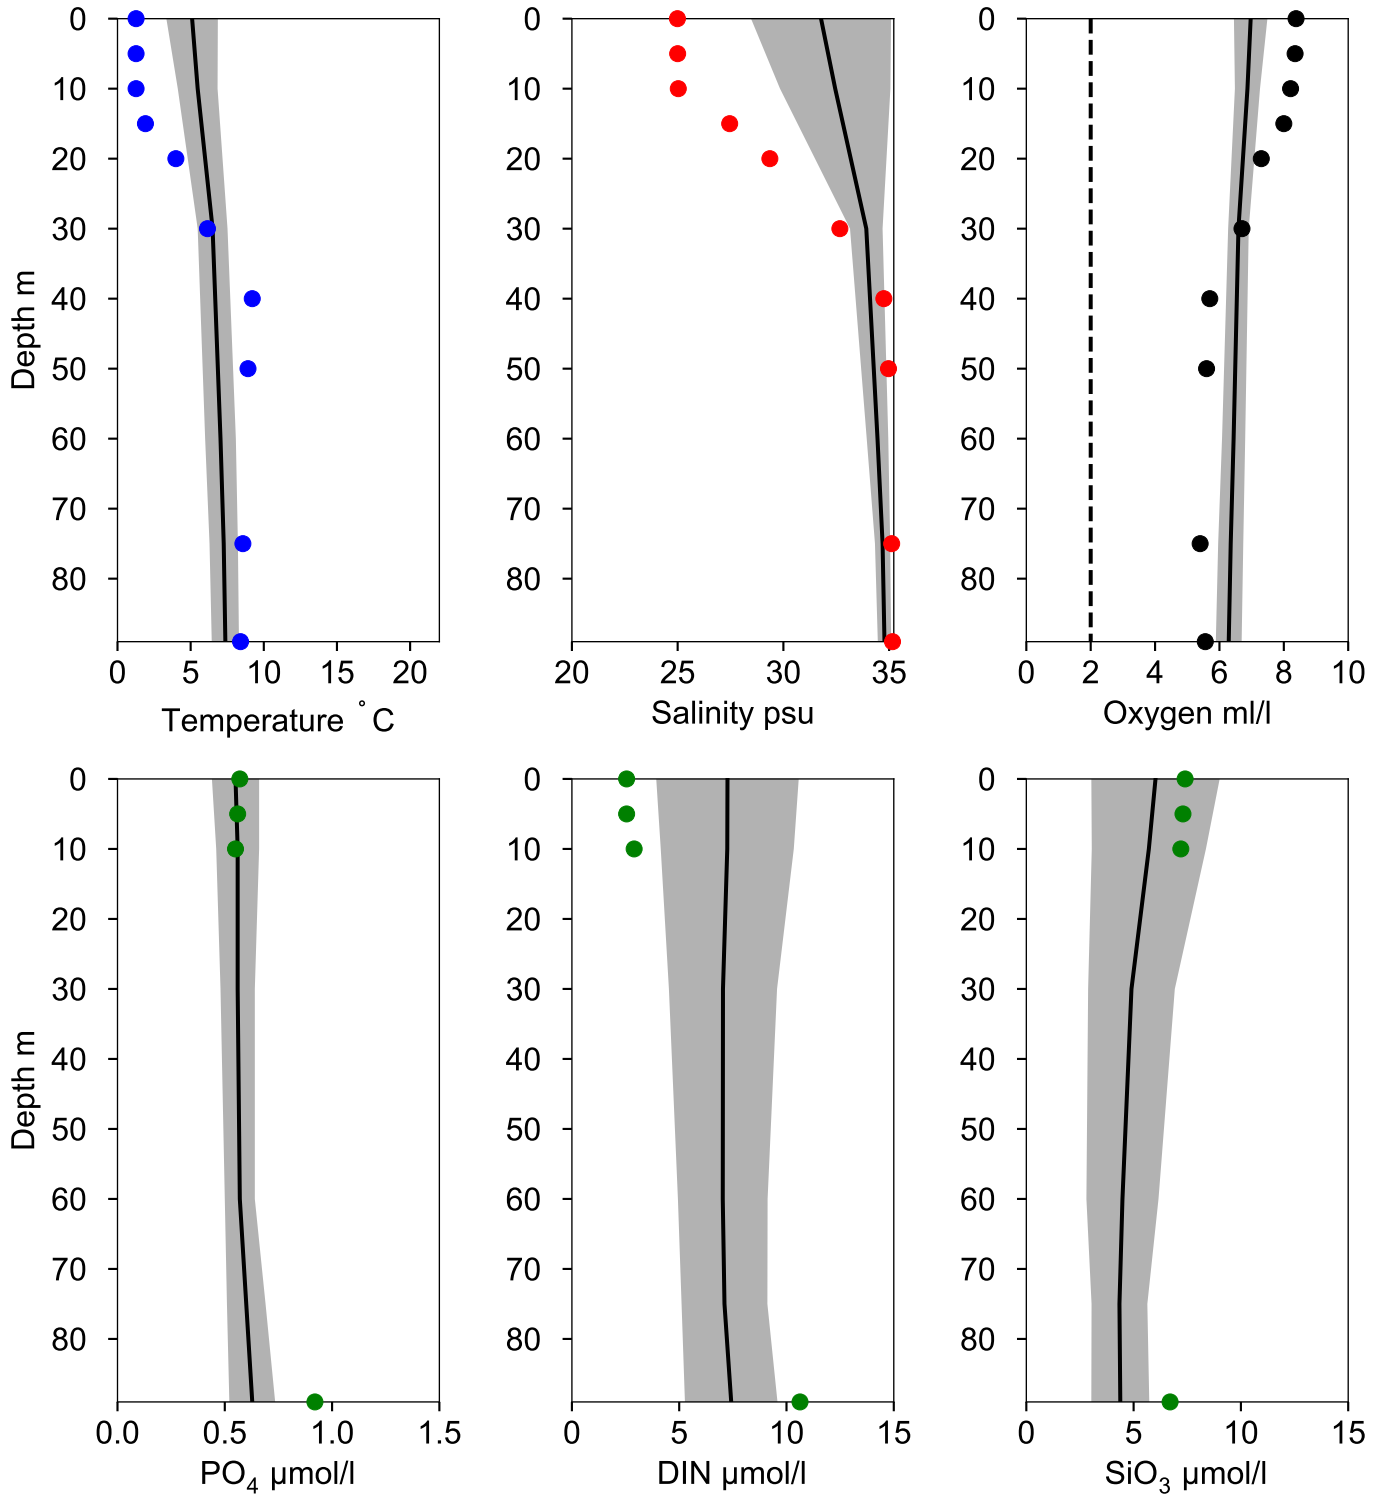

— Mean 1991-2020 St.Dev. ● 2026-01-31

Vertical profiles PERSGRUND January

Statistics based on data from: Skagerrak

— Mean 1991-2020 ■ St.Dev. ● 2026-01-31

STATION 17 N HIRTSHALS SURFACE WATER (0-10 m)

Annual Cycles

Statistics based on data from: Skagerrak

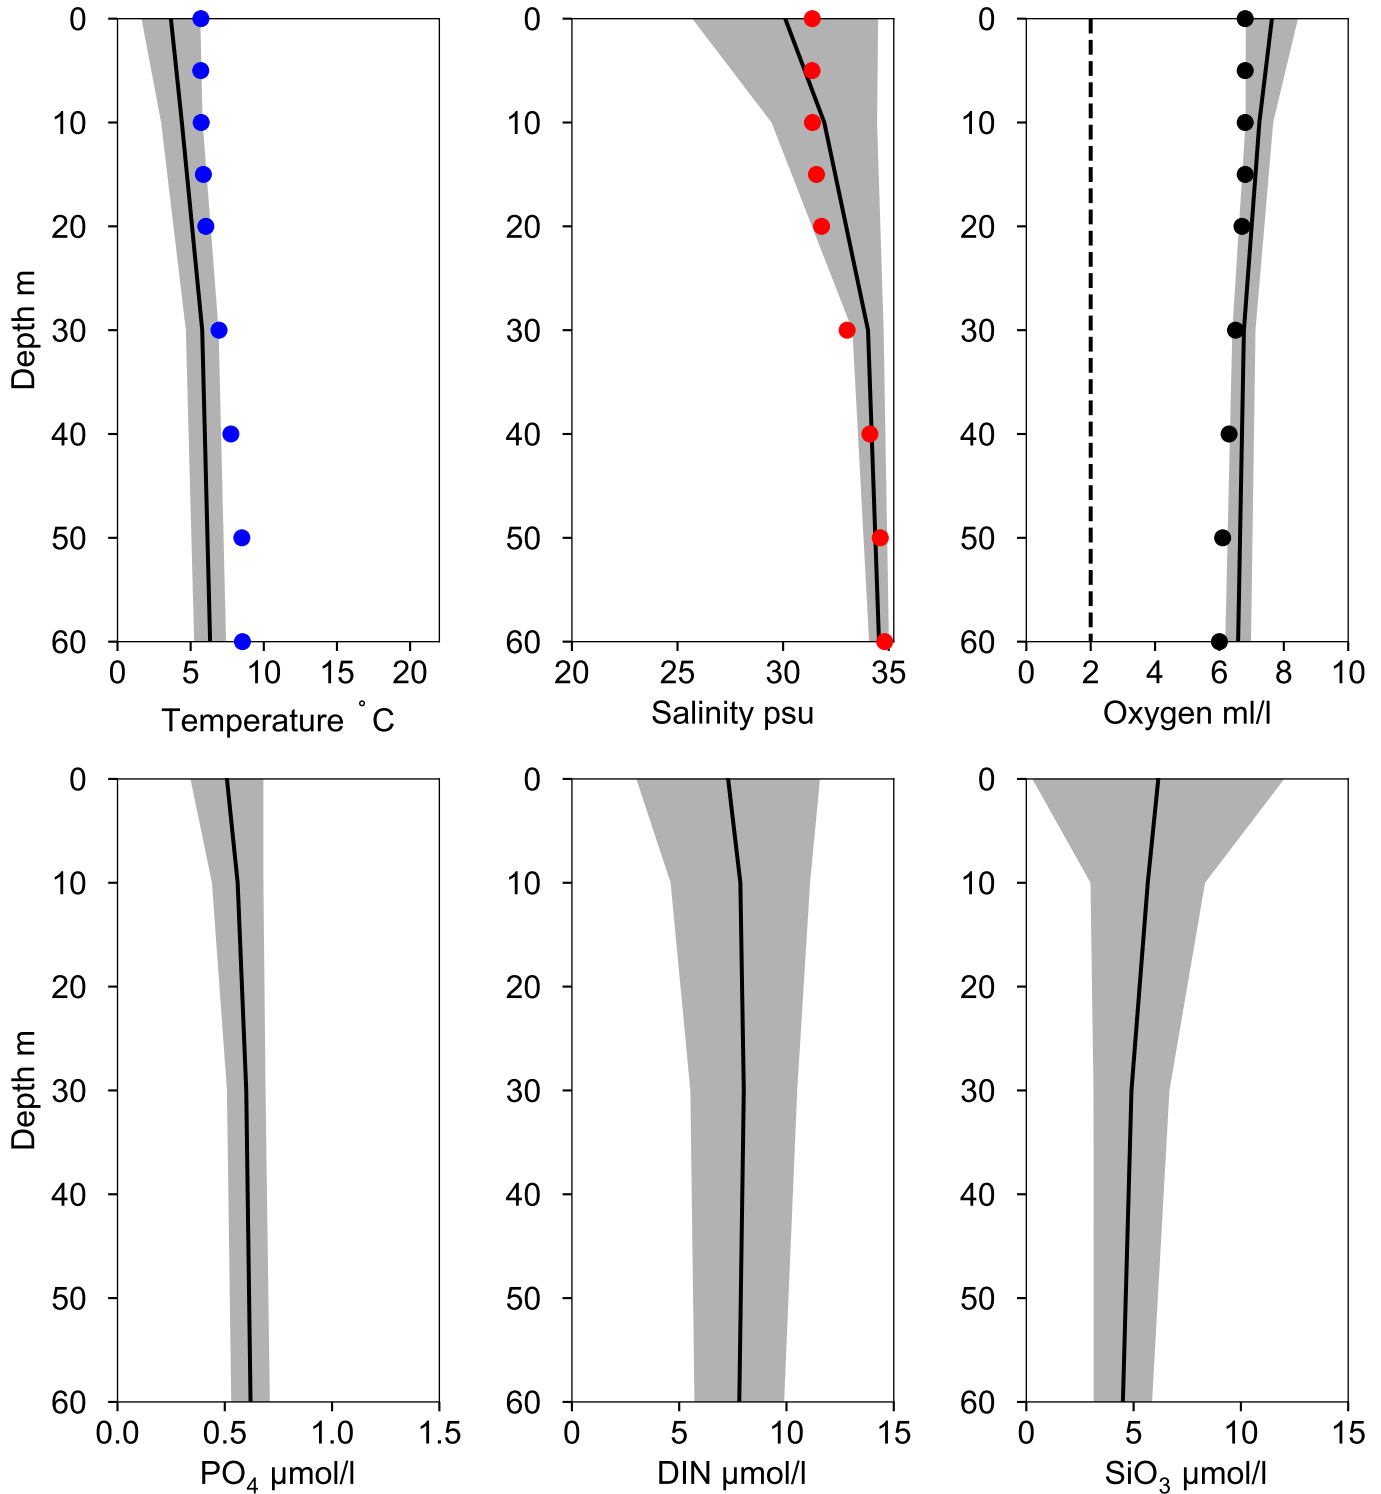

— Mean 1991-2020 ■ St.Dev. ● 2026

Vertical profiles 17 N HIRTSHALS February

Statistics based on data from: Skagerrak

— Mean 1991-2020 ■ St.Dev. ● 2026-02-01

STATION 4.5 N SKAGEN SURFACE WATER (0-10 m)

Annual Cycles

Statistics based on data from: Skagerrak

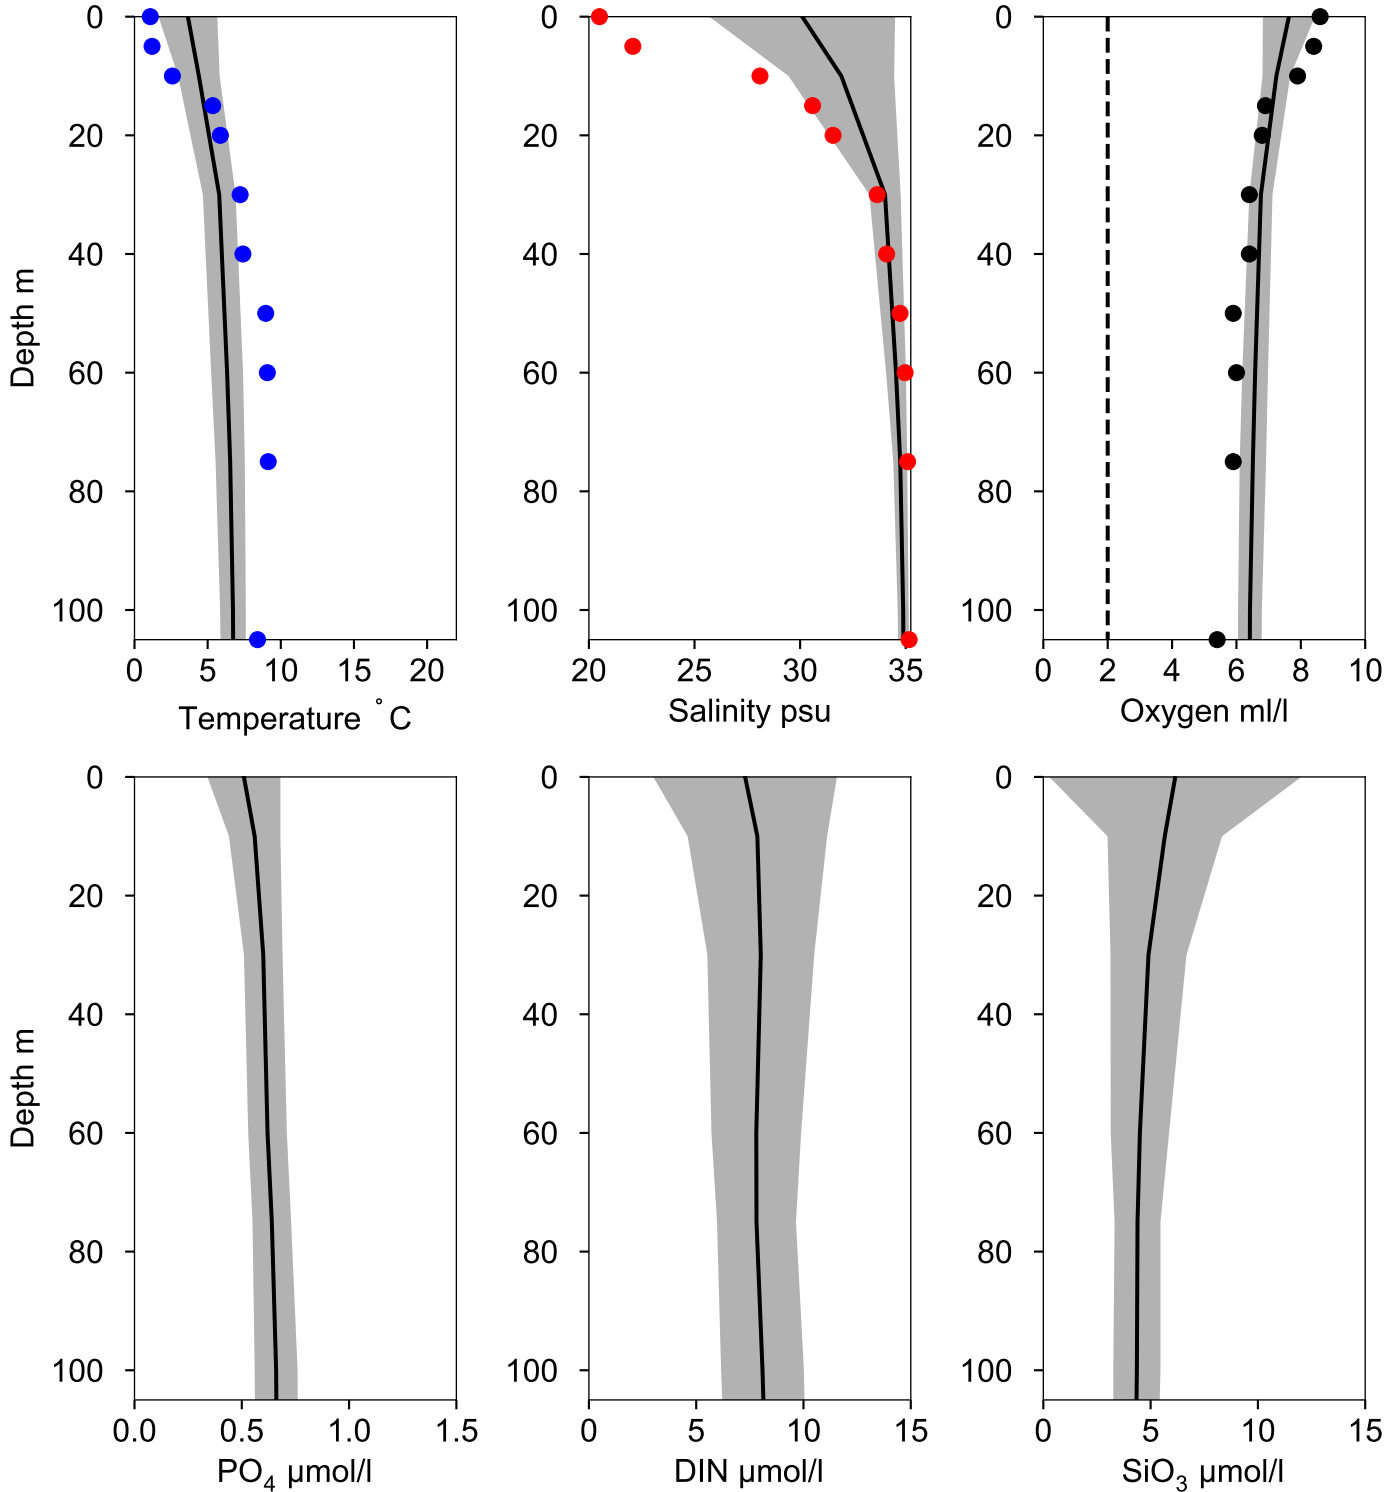

— Mean 1991-2020 ■ St.Dev. ● 2026

Vertical profiles 4.5 N SKAGEN February

Statistics based on data from: Skagerrak

— Mean 1991-2020 ■ St.Dev. ● 2026-02-01

STATION FERRYBOX SURFACE WATER (0-10 m)

Annual Cycles

Statistics based on data from: Skagerrak

— Mean 1991-2020 ■ St.Dev. ● 2026

Vertical profiles FERRYBOX January

Statistics based on data from: Skagerrak

— Mean 1991-2020 ■ St.Dev. ● 2026-01-19

STATION FERRYBOX SURFACE WATER (0-10 m)

Annual Cycles

Statistics based on data from: Kattegatt

— Mean 1991-2020 ■ St.Dev. ● 2026

Vertical profiles FERRYBOX January

Statistics based on data from: Kattegatt

— Mean 1991-2020 ■ St.Dev. ● 2026-01-20

STATION FERRYBOX SURFACE WATER (0-10 m)

Annual Cycles

Statistics based on data from: Kattegatt

— Mean 1991-2020 ■ St.Dev. ● 2026

Vertical profiles FERRYBOX January

Statistics based on data from: Kattegatt

— Mean 1991-2020 ■ St.Dev. ● 2026-01-21

STATION FERRYBOX SURFACE WATER (0-10 m)

Annual Cycles

Statistics based on data from: Kattegatt

— Mean 1991-2020 ■ St.Dev. ● 2026

Vertical profiles FERRYBOX January

Statistics based on data from: Kattegatt

— Mean 1991-2020 ■ St.Dev. ● 2026-01-22

STATION FERRYBOX SURFACE WATER (0-10 m)

Annual Cycles

Statistics based on data from: Kattegatt

— Mean 1991-2020 ■ St.Dev. ● 2026

Vertical profiles FERRYBOX January

Statistics based on data from: Kattegatt

— Mean 1991-2020 ■ St.Dev. ● 2026-01-23

STATION FERRYBOX SURFACE WATER (0-10 m)

Annual Cycles

Statistics based on data from: Kattegatt

— Mean 1991-2020 ■ St.Dev. ● 2026

Vertical profiles FERRYBOX January

Statistics based on data from: Kattegatt

— Mean 1991-2020 ■ St.Dev. ● 2026-01-24

Vertical profiles FERRYBOX January

— Mean 1991-2020 ■ St.Dev. ● 2026-01-25

Vertical profiles FERRYBOX January

— Mean 1991-2020 ■ St.Dev. ● 2026-01-26

STATION FERRYBOX SURFACE WATER (0-10 m)

Annual Cycles

Statistics based on data from: Skagerrak

— Mean 1991-2020 ■ St.Dev. ● 2026

Vertical profiles FERRYBOX January

Statistics based on data from: Skagerrak

— Mean 1991-2020 ■ St.Dev. ● 2026-01-28

STATION FERRYBOX SURFACE WATER (0-10 m)

Annual Cycles

Statistics based on data from: Skagerrak

— Mean 1991-2020 ■ St.Dev. ● 2026

Vertical profiles FERRYBOX January

Statistics based on data from: Skagerrak

— Mean 1991-2020 ■ St.Dev. ● 2026-01-28

STATION FERRYBOX SURFACE WATER (0-10 m)

Annual Cycles

Statistics based on data from: Kattegatt

— Mean 1991-2020 ■ St.Dev. ● 2026

Vertical profiles FERRYBOX January

Statistics based on data from: Kattegatt

— Mean 1991-2020 ■ St.Dev. ● 2026-01-29

STATION FERRYBOX SURFACE WATER (0-10 m)

Annual Cycles

Statistics based on data from: Skagerrak

— Mean 1991-2020 ■ St.Dev. ● 2026

Vertical profiles FERRYBOX January

Statistics based on data from: Skagerrak

— Mean 1991-2020 ■ St.Dev. ● 2026-01-30

STATION FERRYBOX SURFACE WATER (0-10 m)

Annual Cycles

Statistics based on data from: Skagerrak

— Mean 1991-2020 ■ St.Dev. ● 2026

Vertical profiles FERRYBOX January

Statistics based on data from: Skagerrak

— Mean 1991-2020 ■ St.Dev. ● 2026-01-31
