

Sammanfattning

Vid de flesta växtplanktonstationer i Västerhavet dominerade små celler. Kalkalgen *Emiliania huxleyi* dominerade vid Å17 och var vanlig vid övriga stationer i Västerhavet. Vid Kattegattstationerna återfanns spår av vårbloomingen då både *Skeletonema marinoi* och *Guinardia delicatula* återfanns i högre cell antal. De integrerade klorofyllhalterna visade på låga halter, men inom det normala för månaden.

Generellt sätt var både cellantal och artdiversiteten låg på samtliga stationer i Östersjön. Låga till måttliga antal av filament av cyanobakterien *Aphanizomenon flosaquae* återfanns vid samtliga stationer. Det potentiellt giftiga dinoflagellatsläktet *Dinophysis** återfanns i högre tätheter vid ett par stationer. De integrerade klorofyllhalterna visade på låga halter och ibland under det normala för månaden.

Abstract

Most stations along the Swedish West coast had a domination of small cells. The coccolithophore *Emiliania huxleyi* was common at all stations and even dominated in cell numbers at Å17. In Kattegat remnants of the spring bloom could be seen with higher cell numbers of the diatoms *Skeletonema marinoi* and *Guinardia delicatula*. The integrated chlorophyll concentrations were low but within normal for the month.

The cell abundance and biodiversity was generally quite low at most stations in the Baltic Proper. Low to moderate filaments of the cyanobacteria *Aphanizomenon flosaquae* was found at all stations. The potentially toxic dinoflagellate genus *Dinophysis** was found in relatively high numbers at a few stations. The integrated chlorophyll concentrations were low and sometimes even below normal for the month.

Below follows a more detailed information on species composition and abundance. Species marked with * are potentially toxic or harmful.

The Skagerrak

Å17 (open Skagerrak) 12th of May

High total cell concentrations dominated by small cells. Only a few large cells were found. The community was dominated by the coccolithophore *Emiliana huxleyi* that was found in numbers close to half a million cells per litre. Among the larger cells the diatom *Skeletonema marinoi* was most common. The integrated chlorophyll concentrations were within normal for this month.

Släggö (Skagerrak coast) 14th of May

Total cell numbers was relatively high but biodiversity was moderate. The diatom *Skeletonema marinoi* dominated in cell numbers. The smaller cells were dominated by coccolithophore *Emiliana huxleyi*, the dinoflagellate *Karlodinium veneficum** and different Cryptomonadales. The sample was taken outside the ordinary cruise. The chlorophyll results are not shown in this report.

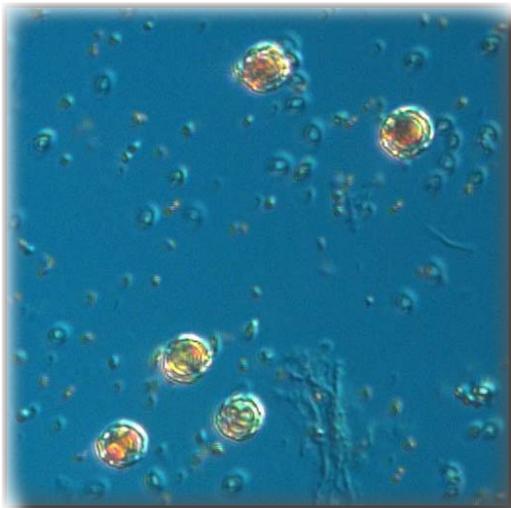

Photo 1: The coccolithophore *Emiliana huxleyi* was found in moderate to high cell numbers at all stations along the Swedish West coast.

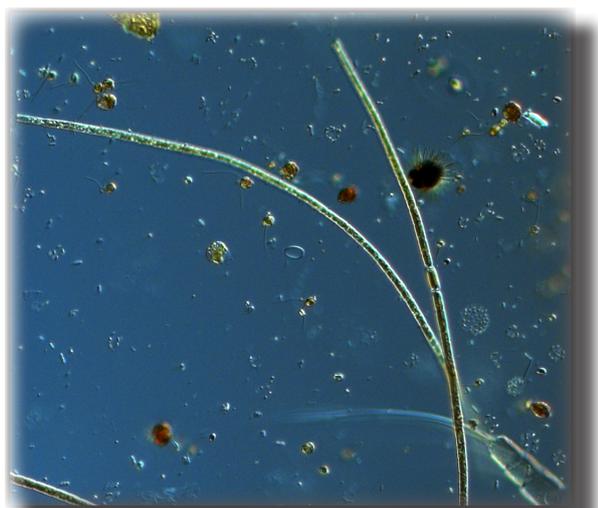

Photo 2: The filamentous cyanobacterium *Aphanizomenon flosaquae* was found in low or moderate numbers at all of the Baltic stations.

The Kattegat

Anholt E 12th and 13th of May

The total cell number was low and dominated by small cells of unknown taxonomic place. Among the larger cells the diatoms *Proboscia alata*, *Skeletonema marinoi* and *Guinardia delicatula* were found in highest cell numbers. The coccolithophore *Emilia huxleyi* was found in moderate cell numbers on both occasions. The integrated (0-10 and 0-20 m) chlorophyll concentrations were low but within normal for this month.

N14 Falkenberg 13th of May

The total cell concentration was low and the biodiversity moderate. Mainly small cells were found. Among the larger cells the diatoms *Proboscia alata* and *Guinardia delicatula* were most common. The small cells were dominated by moderate cell numbers of *Emiliana huxleyi*. The integrated (0-10 and 0-20 m) chlorophyll concentrations were low but within normal for this month.

The Baltic Sea

BY2 11th of May

Low total cell numbers was found mainly represented by small cells such as the dinoflagellate *Heterocapsa rotundata*. Different colony forming cyanobacteria such as *Aphanocapsa* spp., and *Snowella* spp. were also present in higher numbers. Different species belonging to the order cryptomonadales were present in higher cell concentrations. The filamentous cyanobacteria *Aphanizomenon flosaquae* was present with several filaments. The integrated (0-10 and 0-20 m) chlorophyll concentrations were low but within normal for this month.

BY5 11th of May

Low total cell numbers was found. The dinoflagellate *Dinophysis norvegica** was found in moderate cell numbers. The filamentous cyanobacteria *Aphanizomenon flosaquae* was also present in higher numbers. Different ciliates were common and among these *Mesodinium rubrum*. The integrated (0-10 and 0-20 m) chlorophyll concentrations were low but within normal for this month.

BY15 10th of May

Total cell numbers were moderate. The filamentous cyanobacteria *Aphanizomenon flosaquae* was found in relatively high filaments. The dinoflagellate *Peridiniella catenata* was also found in higher cell numbers together with *Dinophysis acuminata**. Among the small cells, the Crysophyceae *Dinobryon balticum* was found in high cell numbers. The integrated (0-10 and 0-20 m) chlorophyll concentrations were below of what is normal for this month.

BY20 10th of May

Total cell numbers were low. Among the larger cells the dinoflagellates *Peridiniella catenata* and *Dinophysis acuminata* were found in highest numbers. Among the small cells the Crysophyceae *Dinobryon balticum* was found in higher cell numbers. The mixotrophic ciliate *Mesodinium rubrum* was also abundant. The integrated (0-10 and 0-20 m) chlorophyll concentrations were just below of what is normal for this month.

BCSIII-10 11th of May

Low total cell concentration mainly small cells found. A few filaments of the cyanobacteria *Aphanizomenon flosaquae* were found. Among the small cells the dinoflagellate *Heterocapsa rotunda* was most abundant together with lesser amount of the order Cryptomonadales and different species of *Pyramimonas* spp. Smaller unicells without flagella was also found but could not be classified to any taxonomic group. The integrated (0-10 and 0-20 m) chlorophyll concentrations were just below of what is normal for this month.

BY29 10th of May

Moderate cell concentrations were found. The larger cells were dominated by cells belonging to the dinoflagellate order Gymnodiniales. The smaller cells were dominated by different species belonging to the genus *Dinobryon*. The integrated (0-10 and 0-20 m) chlorophyll concentrations were just below of what is normal for this month. No chlorophyll is presented for this station.

RefM1V1 14th of May

There was low cell concentration and biodiversity at this station. Common species were the diatom *Skeletonema marinoi* and several cells of the potentially toxic dinoflagellate *Dinophysis acuminata**. Large cells of a ciliate were also present in higher amounts together with *Mesodinium rubrum*. The integrated (0-10 and 0-20 m) chlorophyll concentrations were below of what is normal for this month.

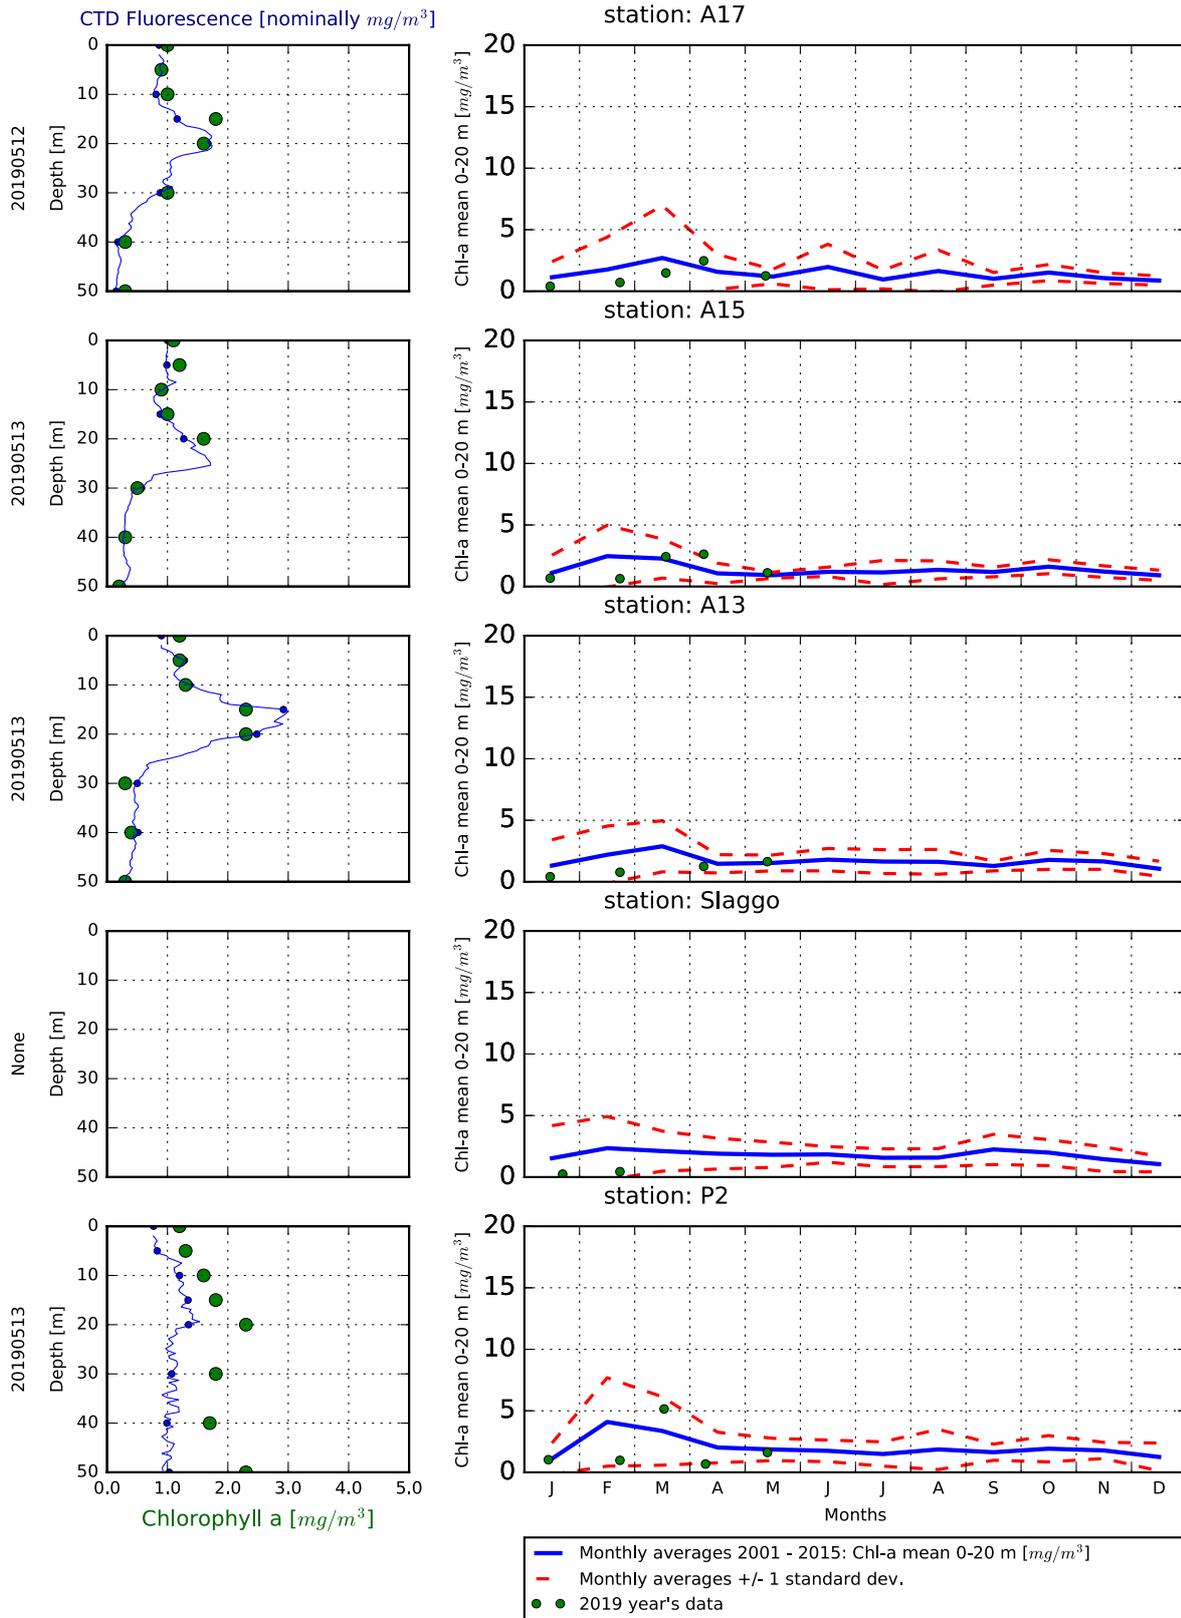

BY38 15th of May

Low cell concentrations and mainly small cells were found. Among the larger cells the cyanobacteria *Aphanizomenon flosaquae* and the potentially toxic species *Dinophysis acuminata** were present. Among the smaller cells the chrysophyte *Dinobryon balticum* was found in moderate cell concentrations. Quite a few cells of different ciliates were also found. The integrated (0-10 and 0-20 m) chlorophyll concentrations were low but within normal for this month.

The Skagerrak

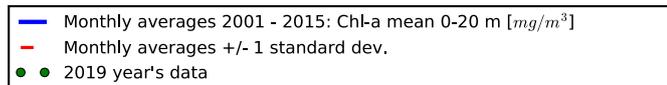

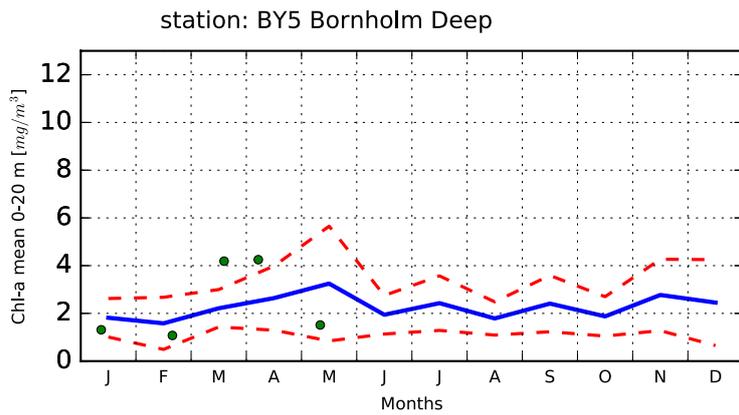

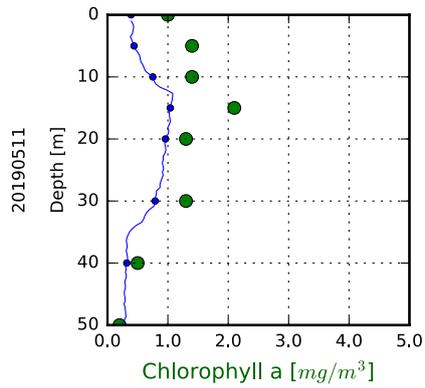

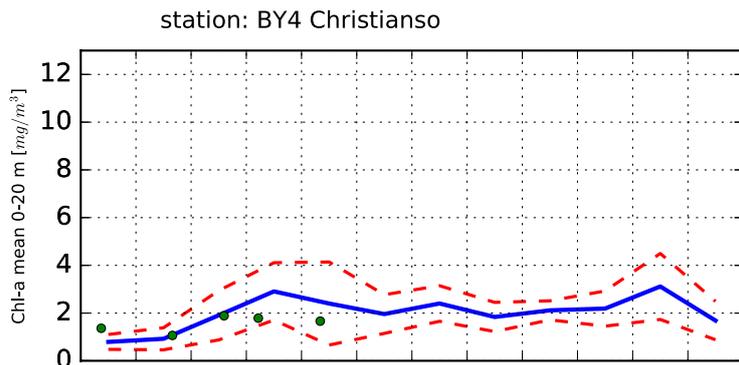

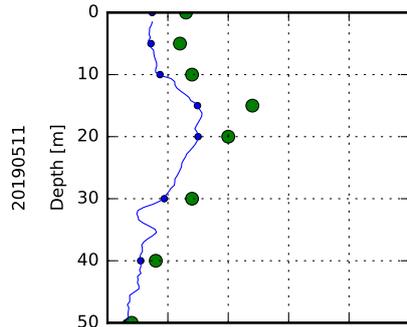

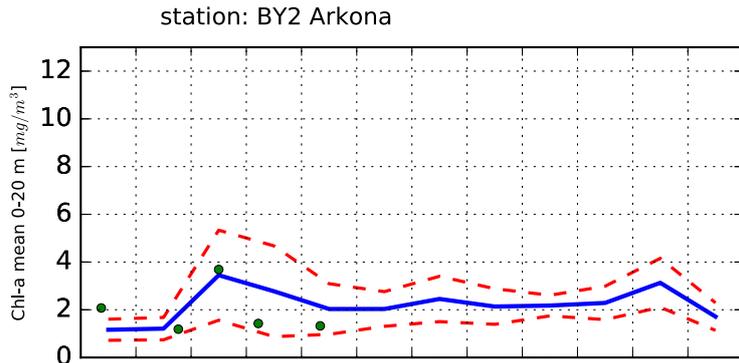

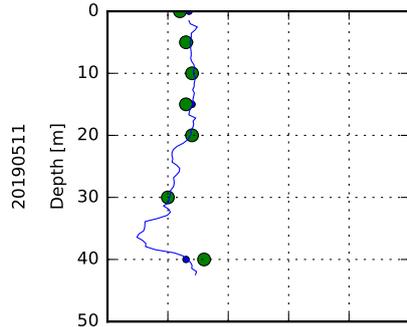

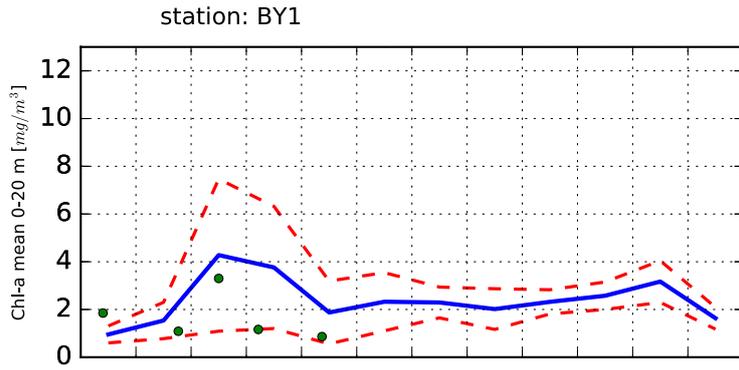

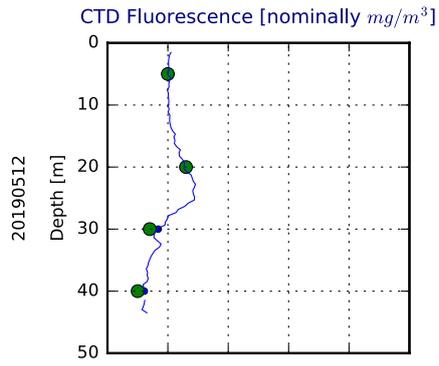

No permission was granted to sample at Släggö close to the Skagerrak coast due to using the foreign vessel R/V Aranda.

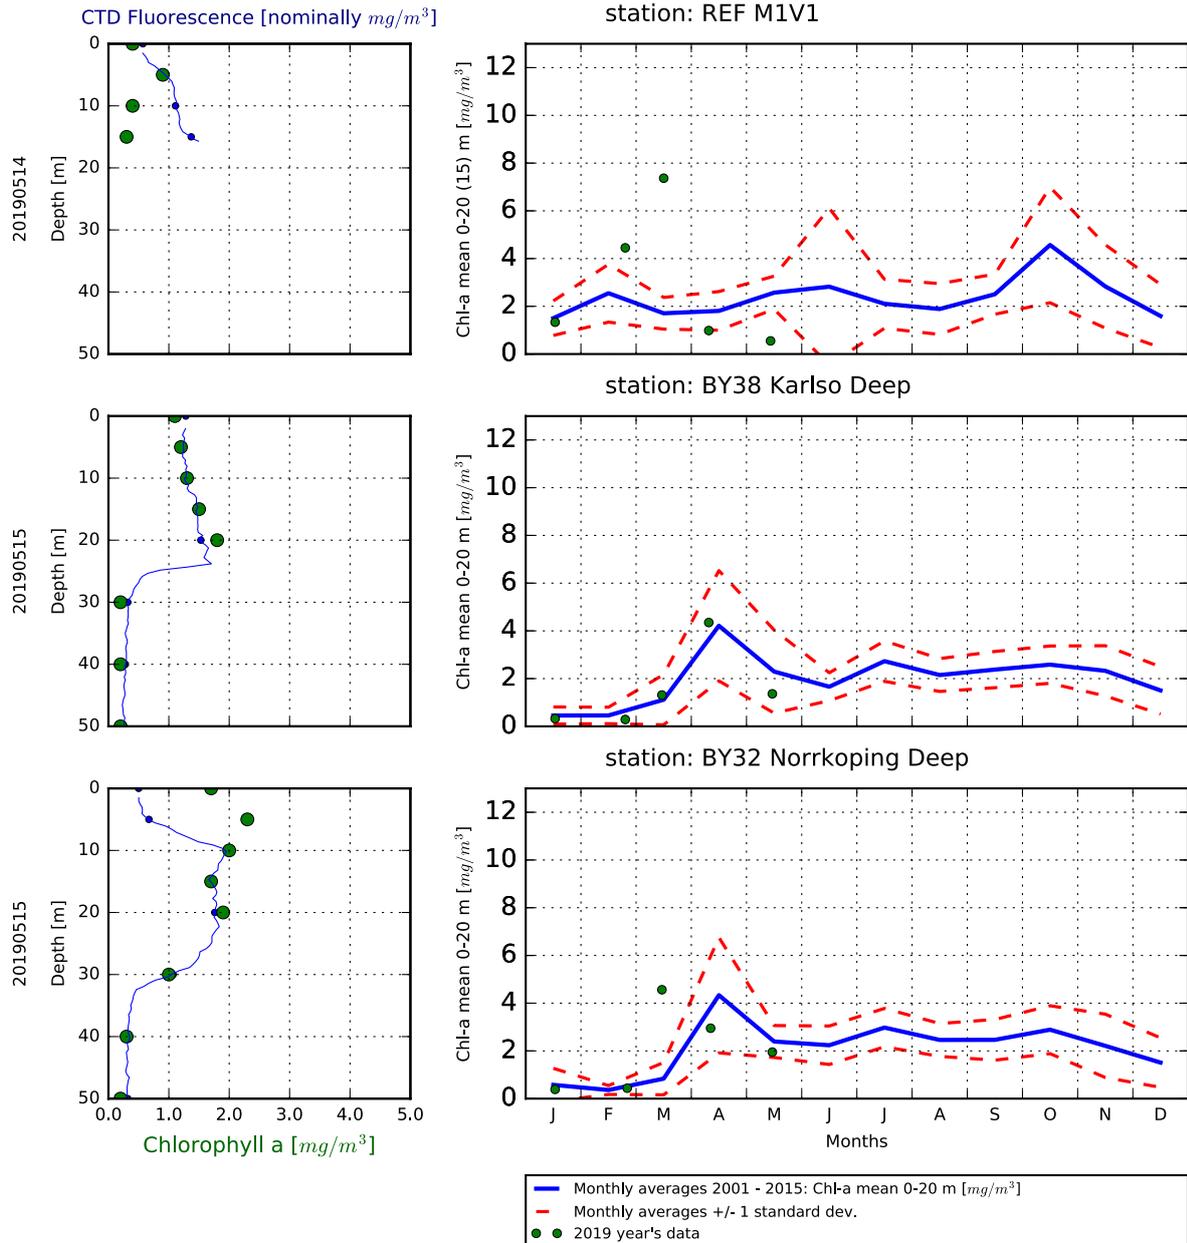

The Kattegat and The Sound

The Southern Baltic

The Western Baltic

Om klorofylldiagrammen

Klorofyll *a* är ett mått på mängden växtplankton. Prover tas från ett antal djup. Data presenteras både från de fasta djupen och som medelvärden 0-20 m. Utöver resultaten från laboratorieanalyserna av vattenprover mäts klorofyll *a* som fluorescens från ett automatiskt instrument som sänks ned från fartyget. På så sätt kan djupt liggande, ibland tunna lager av växtplankton observeras.

About the chlorophyll graphs

Chlorophyll *a* is sampled from several depths. Data are presented both from the discrete depths and as an average 0-20 m. In addition to the laboratory analysis from the water samples chlorophyll fluorescence is measured in continuous depth profiles from the ship. This is a way to observe thin layers of phytoplankton occurring below the surface.

Om AlgAware

SMHI genomför månatliga expeditioner i Östersjön och Västerhavet. Resultat baserade på semikvantitativ mikroskopisk analys av planktonprover samt klorofyllmätningar presenteras kortfattat i denna rapport. Information från SMHIs satellitövervakning av algbloomningar finns under perioden juni-augusti på www.smhi.se. Resultat från provtagningarna kan hämtas från SMHI:s databas på sharkweb.smhi.se. Hydrografidata läggs ut varje månad, växtplanktondata läggs ut en gång per år.

About AlgAware

SMHI carries out monthly cruises in the Baltic and the Kattegat/Skagerrak. Results from semi quantitative microscopic analysis of phytoplankton samples as well as chlorophyll measurements are presented in brief in this report. Information from SMHIs satellite monitoring of algal blooms is found on www.smhi.se during the period June-August. Results from the expeditions are found in the SMHI database, sharkweb.smhi.se. Data are published monthly, phytoplankton data however, are published once a year.

Art / Species	Gift / Toxin	Eventuella symptom	Clinical symptoms
<i>Alexandrium</i> spp.	Paralytic shellfish poisoning (PSP)	Milda symptom: Inom 30 min.: Stickningar eller en känsla av bedövning runt läpparna, som sprids gradvis till ansiktet och nacken; stickningar i fingertoppar och tår; Huvudvärk; yrsel, illamående, kräkningar, diarré Extrema symptom: Muskelförlamning; andningssvårigheter; känsla av att kvävas; Man kan vara död inom 2-24 timmar efter att ha fått i sig giftet, på grund av att andningsmuskulaturen förlamas.	Mild case: Within 30 min: tingling sensation or numbness around lips, gradually spreading to face and neck; prickly sensation in fingertips and toes; headache, dizziness, nausea, vomiting, diarrhoea. Extreme case Muscular paralysis; pronounced respiratory difficulty; choking sensation; death through respiratory paralysis may occur within 2-24 hours after ingestion.
<i>Dinophysis</i> spp.	Diarrhetic shellfish poisoning (DSP)	Milda symptom: Efter cirka 30 minuter till några timmar: yrsel, illamående, kräkningar, diarré, magont Extrema symptom: Upprepad exponering kan orsaka cancer	Mild case: Within 30 min-a few hours: dizziness, nausea, vomiting, diarrhoea, abdominal pain. Extreme case: Repeated exposure may cause cancer.
<i>Pseudo-nitzschia</i> spp.	Amnesic shellfish poisoning (ASP)	Milda symptom: Efter 3-5 timmar: yrsel, illamående, kräkningar, diarré, magkramp Extrema symptom: Yrsel, hallucinationer, förvirring, förlust av korttidsminnet, kramper	Mild case: Within 3-5 hours: dizziness, nausea, vomiting, diarrhoea, abdominal cramps. Extreme case: dizziness, hallucinations, confusion, loss of memory, cramps.
<i>Chaetoceros concavicornis</i> / <i>C. convolutus</i>	Mechanical damage through hooks on setae	Låg celltäthet: Ingen påverkan. Hög celltäthet: Fiskens gälar skadas, fisken dör.	Low cell numbers: No effect on fish. High cell numbers: Fish death due to gill damage.
<i>Pseudochattonella</i> spp.	Fish toxin	Låg celltäthet: Ingen påverkan. Hög celltäthet: Fiskens gälar skadas, fisken dör.	Low cell numbers: No effect on fish. High cell numbers: Fish death due to gill damage.

Oversikt över några potentiellt skadliga alger och det aktuella giftets effekt. Overview of potentially harmful algae and effects of toxins. Manual on harmful marine microalgae (2003 - UNESCO Publishing).

Kartan på framsidan visar viktat medelvärde för klorofyll *a*, µg/l (0-10 m) vid de olika stationerna. Pil upp eller ned indikerar om resultatet är över eller under en standardavvikelse från medel. Medel är beräknat utifrån aktuell månad under perioden 2001-2015. Förekomst av skadliga alger vid stationer där arter analyseras markeras med symbol.

The map on the front page shows weighted mean of chlorophyll *a*, µg/l (0-10 m) at sampling stations. The arrow up or down indicate whether the result is above or below one standard deviation from mean. The mean value is calculated using results from the actual month during the period 2001-2015. Presence of harmful algae at stations where species analysis is performed is shown with a symbol.
