

Teach your parents
**How does climate change
affect extreme weather?**

<p>1 South Europe, west africa and North America</p> <p>Will have the biggest changes including more frequent wildfires and decreases in crop yields</p>	<p>2 The risk</p> <p>for wildfires, decreasing of crop yields ect. are much lower at a temperature rise of 1.5 degrees celsius compared to a rise of 2 degrees celsius. (Paris agreement)</p>
<p>3 Countries with low levels of fresh water</p> <p>as Sierra Leone, Nigeria, Liberia ect. are a few of the countries with a potentially decrease of water availability.</p>	<p>4 The summer of 2018</p> <p>Broke heat and drought records all over Europe and North America. Shouldn't we take it as a warning?</p>
<p>5 Nearly 700</p> <p>more deaths than average were recorded during the 15-day peak of the heatwave in June and July in England and Wales. (Office for National Statistics)</p>	<p>6 Today..</p> <p>We can clearly see consequences of our extreme use of fossil fuels. Imagine the effects for the upcoming generation.</p>

**If everyone will be effected, why
can't everyone fight against global
climat change?**
