

## Sammanfattning

Generellt sett hade spridningen och förekomsten av växtplankton inte förändrats nämnvärt jämfört med den förra expeditionen. Detta med undantag av att trådformade cyanobakterier observerades, och att kolonibildande cyanobakterier inte observerades. Vid samtliga Östersjöstationer var planktonfloran fattig, och bara små, oidentifierade flagellater var talrika på vissa stationer. I kustnära Skagerrak däremot, var situationen annorlunda med många arter av både kiselalger och dinoflagellater, dock i låga cellantal. I Kattegatt observerades färre växtplankton än i Skagerrak, men flera än vid Östersjöstationerna.

## Abstract

The general picture of phytoplankton species distribution and occurrence did not exhibit any remarkable changes from what it was in the previous expedition, except that cyanobacterial filaments were observed and that cyanobacterial colonies were not observed. A shared feature among all Baltic Sea stations was the poor representations of phytoplankton. The relatively high number of cell counts in some stations was due to the presence of many small unidentified flagellates. In the Skagerrak, however, the situation was completely different especially at Släggö, where both diatoms and dinoflagellates were diversified. Although cell numbers were not high (384710 cells/l), yet relatively large number of species appeared. Phytoplankton in the Kattegatt was less abundant than in the Skagerrak, but, on the other hand, more species occurred there than in all of the Baltic stations.

## Om AlgAware

SMHI genomför ca en gång per månad expeditioner med U/F Argos i Östersjön och Västerhavet. Resultat baserade på mikroskopanalys av planktonprover samt klorofyllmätningar presenteras kortfattat i denna rapport. Information från SMHI:s satellitövervakning av algblomningar finns på [www.smhi.se](http://www.smhi.se).

## About AlgAware

SMHI carries out monthly cruises with R/V Argos in the Baltic and the Kattegat/Skagerrak. Results from microscopic analysis of phytoplankton samples as well as chlorophyll measurements are presented in brief in this report. Information from SMHI:s satellite monitoring of algal blooms is found on [www.smhi.se](http://www.smhi.se).

Art / Species	Gift / Toxin	Eventuella symptom	Clinical symptoms
<i>Alexandrium</i> spp.	Paralytic shellfish poisoning (PSP)	<b>Milda symptom:</b> Inom 30 min.: Stickningar eller en känsla av bedövning runt läpparna, som sprids gradvis till ansiktet och nacken; stickningar i fingertoppar och tår; Huvudvärk; yrsel, illamående, kräkningar, diarré <b>Extrema symptom:</b> Muskelförlamning; andningssvårigheter; känsla av att kvävas; Man kan vara död inom 2-24 timmar efter att ha fått i sig giftet, på grund av att andningsmuskulaturen förlamas.	<b>Mild case:</b> Within 30 min: tingling sensation or numbness around lips, gradually spreading to face and neck; prickly sensation in fingertips and toes; headache, dizziness, nausea, vomiting, diarrhoea. <b>Extreme case</b> Muscular paralysis; pronounced respiratory difficulty; choking sensation; death through respiratory paralysis may occur within 2-24 hours after ingestion.
<i>Dinophysis</i> spp.	Diarrhetic shellfish poisoning (DSP)	<b>Milda symptom:</b> Efter cirka 30 minuter till några timmar: yrsel, illamående, kräkningar, diarré, magont <b>Extrema symptom:</b> Upprepad exponering kan orsaka cancer	<b>Mild case:</b> Within 30 min-a few hours: dizziness, nausea, vomiting, diarrhoea, abdominal pain. <b>Extreme case:</b> Repeated exposure may cause cancer.
<i>Chattonella</i> spp.	Fish toxin	<b>Låg celltäthet:</b> Ingen påverkan. <b>Hög celltäthet:</b> Fiskens gälar skadas, fisken dör.	<b>Low cell numbers:</b> No effect on fish. <b>High cell numbers:</b> Fish death due to gill damage.
<i>Pseudo-nitzschia</i> spp.	Amnesic shellfish poisoning (ASP)	<b>Milda symptom:</b> Efter 3-5 timmar: yrsel, illamående, kräkningar, diarré, magkramper <b>Extrema symptom:</b> Yrsel, hallucinationer, förvirring, förlust av korttidsminnet, kramper	<b>Mild case:</b> Within 3-5 hours: dizziness, nausea, vomiting, diarrhoea, abdominal cramps. <b>Extreme case:</b> dizziness, hallucinations, confusion, loss of memory, cramps.

Översikt av potentiellt skadliga alger och det aktuella giftets effekt. Overview of potentially harmful algae and effects of toxins. Manual on harmful marine microalgae (2003 - UNESCO Publishing).

Kartan på framsidan visar viktat medelvärde för klorofyll *a*, µg/l (0-20 m) vid de olika stationerna. Förekomst av skadliga alger vid stationer där arter analyseras markeras med symbol.

The map on the front page shows weighted mean of chlorophyll *a*, µg/l (0-20 m) at sampling stations. Presence of harmful algae at stations where species analysis is performed is shown with a symbol.

More detailed information on species composition and abundance. \* = potentially toxic.

## The Skagerrak

### Å17 24th of October

Phytoplankton was quite rare with no specific dominance of any species. The overall cell density was remarkably low whereas cell numbers did not exceed 78 661 cells/l, most of which were small unidentified flagellates.

### Släggö 24<sup>th</sup> of October

*Peridiniella danica*

In contrast to all other stations, Släggö exhibited a completely different picture of phytoplankton occurrence. Although none of the species dominated the whole phytoplankton population, yet both diatoms and dinoflagellates appeared in a rather similar species distribution. Diatoms were represented by 18 species of which *Chaetoceros* spp. were rather common, and the dinoflagellates represented by 20 species among which *Peridiniella danica* and unidentified naked dinoflagellates were more common. Total cell count reached 384 710 cells/l.

The chlorophyll *a* concentration was below average in open Skagerrak, whereas the concentrations were above average in the coastal parts of the area.

## The Kattegat

### Anholt E 23<sup>rd</sup> of October

In general, number of species and cell density were not high at this station. The most common among diatoms was *Leptocylindrus minimus*. Dinoflagellates were poorly represented except for very small naked dinoflagellates which accounted for most of the cell density that reached 187 904 cell/l.

Other plankton constituents, mostly ciliates were rather common.

At West Landskrona, the chlorophyll *a* concentration was normal for this month, whereas the concentrations were below average in the rest of the area.

*Leptocylindrus minimus*

## The Baltic Sea

### Arkona Basin BY2 23<sup>rd</sup> of October

*Coscinodiscus* sp.

It did not seem that phytoplankton distribution had changed since the last two expeditions in the Baltic. Only three species of diatoms were encountered, of which *Coscinodiscus centralis* was rather common. Dinoflagellates on the other hand were represented by four species, none of which appeared in high numbers. The total cell number was 80 866 cells/l, mostly attributed to the small unidentified flagellates of different taxonomical groups. The chlorophyll *a* concentration was below average.

### Bornholm Basin BY5 18<sup>th</sup> of October

Phytoplankton occurrence was similar to the one at BY2, both diatoms and dinoflagellates were very poorly represented. Only one diatom was observed; *Coscinodiscus centralis*. Most of the cells counted were small flagellates and ciliates. The chlorophyll *a* concentration was below average.

### The South East Baltic BCS III-10 17<sup>th</sup> of October

Two species of diatoms appeared in very low numbers; *Chaetoceros impressus* and *Coscinodiscus centralis*. The total cell count was rather high (335 825 cells/l) compared to the two preceding stations and was completely attributed to small flagellates in the size range 3-5 micrometers. A small population of the dinoflagellate *Prorocentrum minimum*\* was quantified in addition to the same species as the two stations above. The chlorophyll *a* concentration was at average.

### Eastern Gotland Basin BY15 10<sup>th</sup> of October

Two species occurred that were absent from the other stations; *Prorocentrum minimum*\* and *Nodularia spumigena*\*. These species contributed to almost 50% of the total cell amount which reached 299 099 cells/l. Diatoms were extremely rare both in number of species and in cell numbers. The dinoflagellate *Dinophysis acuminata*\* appeared in low cell numbers. The chlorophyll *a* concentration was at average.

*Dinophysis acuminata*

### Western Gotland Basin BY38 11<sup>th</sup> of September

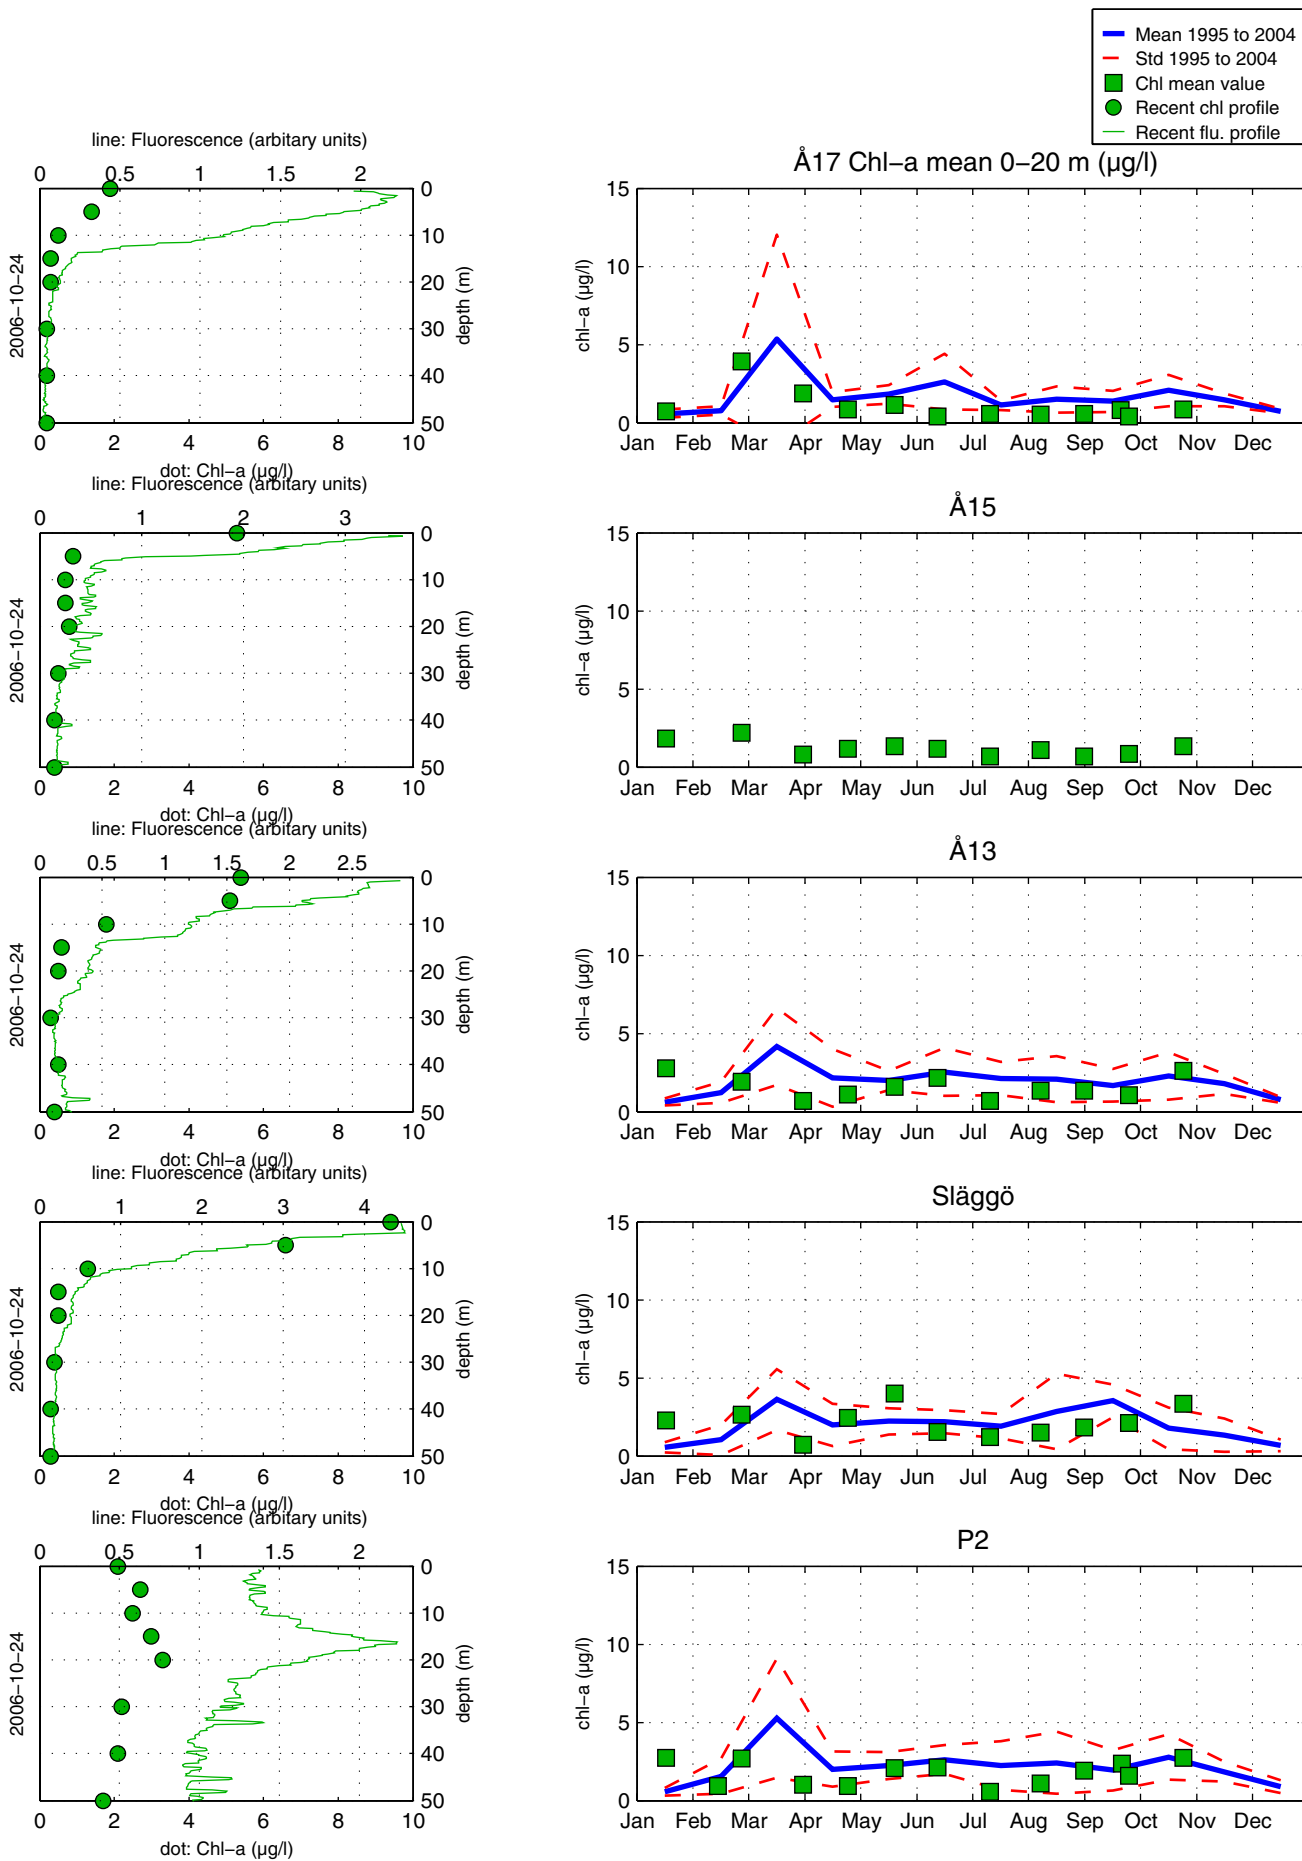

Unidentified cyanobacterial filaments were observed in low numbers. Other phytoplankton components were remarkably rare and cell numbers were low. Diatoms were only represented by two *Chaetoceros* species; *C. impressus* and *C. danicus*. Apart from some small naked cells, dinoflagellates were completely absent in the sample. The chlorophyll *a* concentration was below average.

# The Kattegat and the Sound

## Om klorofylldiagrammen

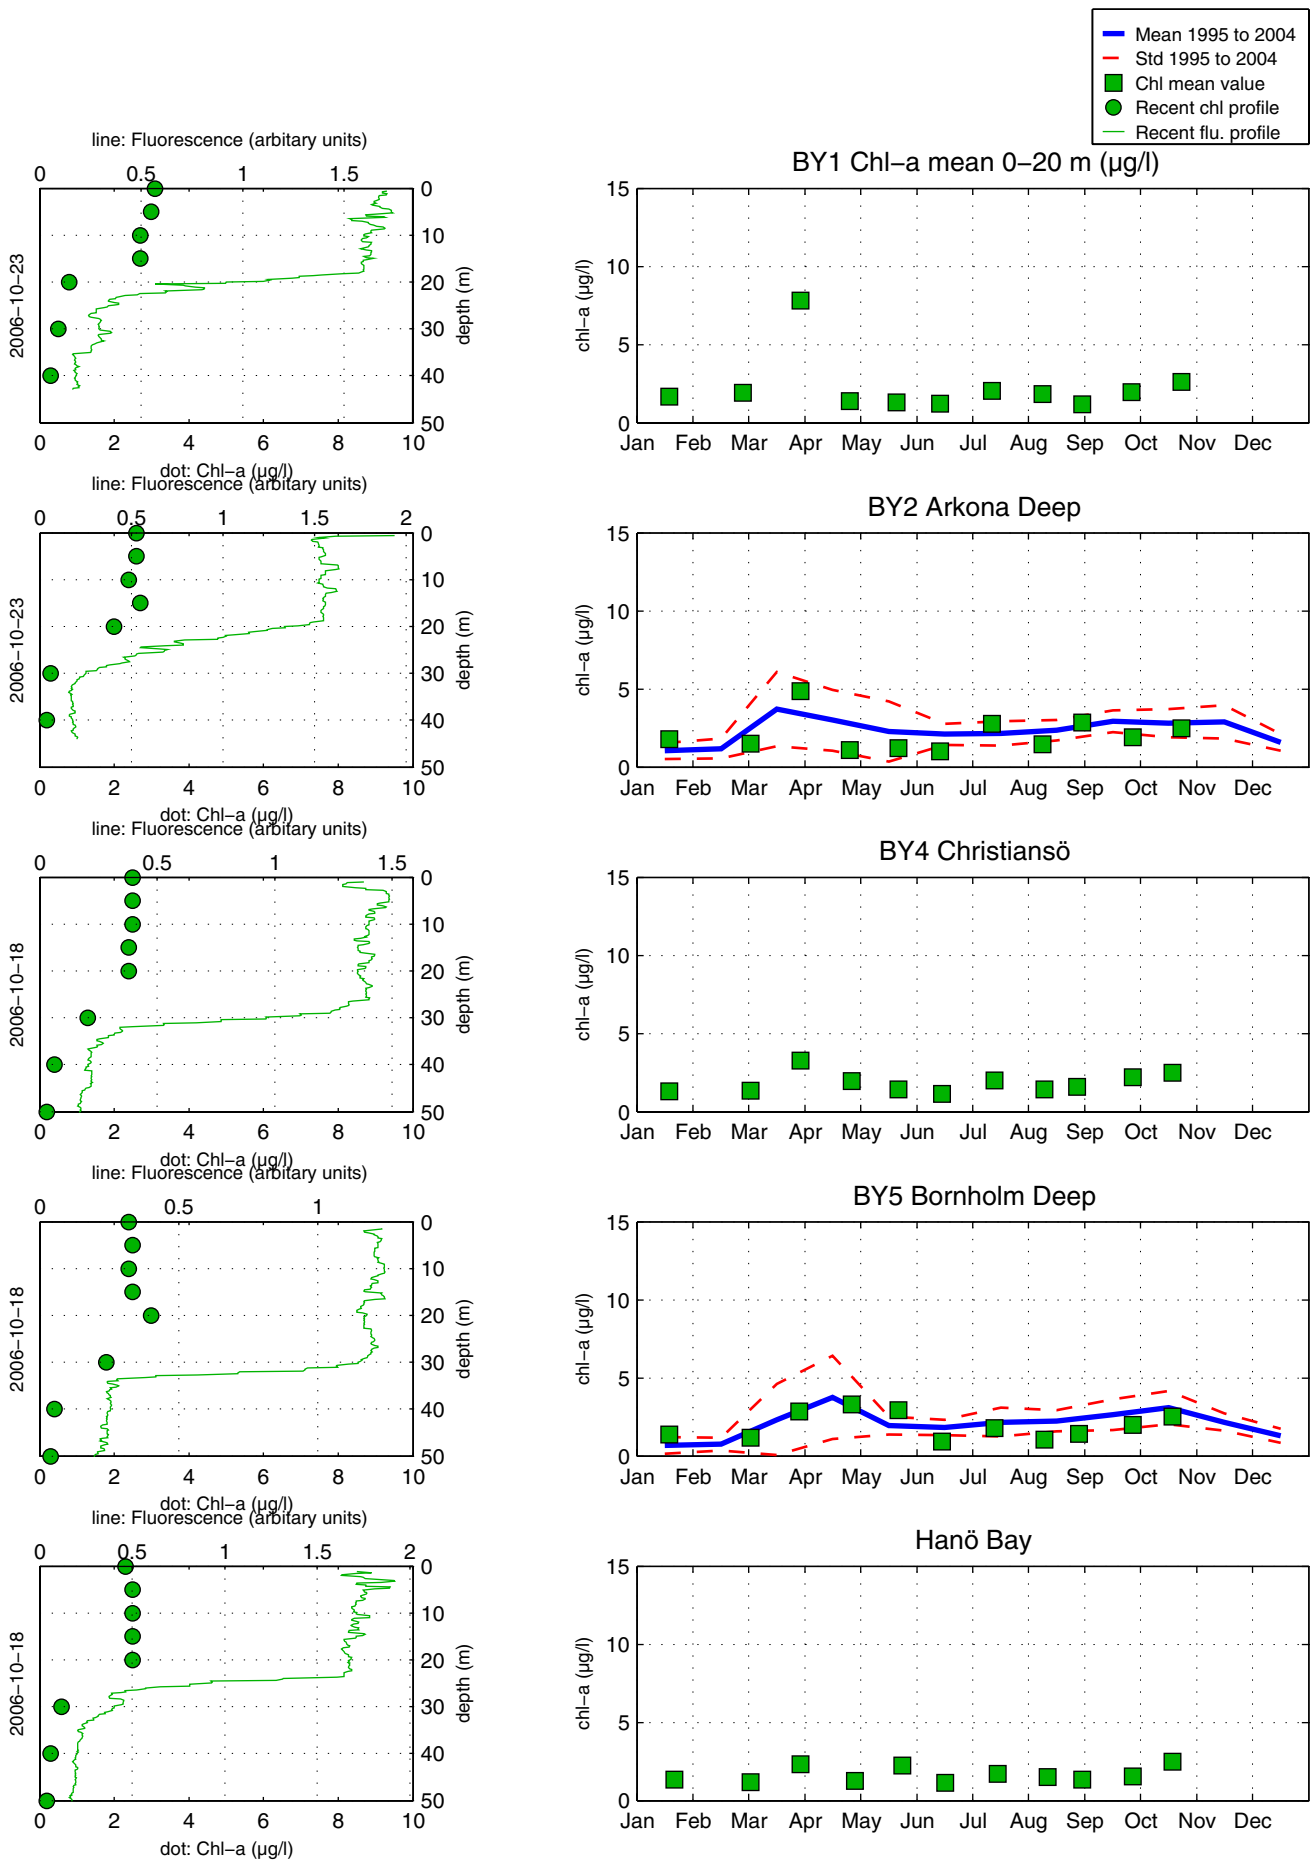

Klorofyll *a* är ett mått på mängden växtplankton. Prover tas från ett antal djup från U/F Argos. Data presenteras både från de fasta djupen och som medelvärden 0-20 m. Utöver resultaten från laboratorieanalyserna av vattenprover mäts klorofyll *a* som fluorescens från ett automatiskt instrument som sänks ned från fartyget. På så sätt kan djupt liggande, ibland, tunna alger av växtplankton observeras.

## About the chlorophyll graphs

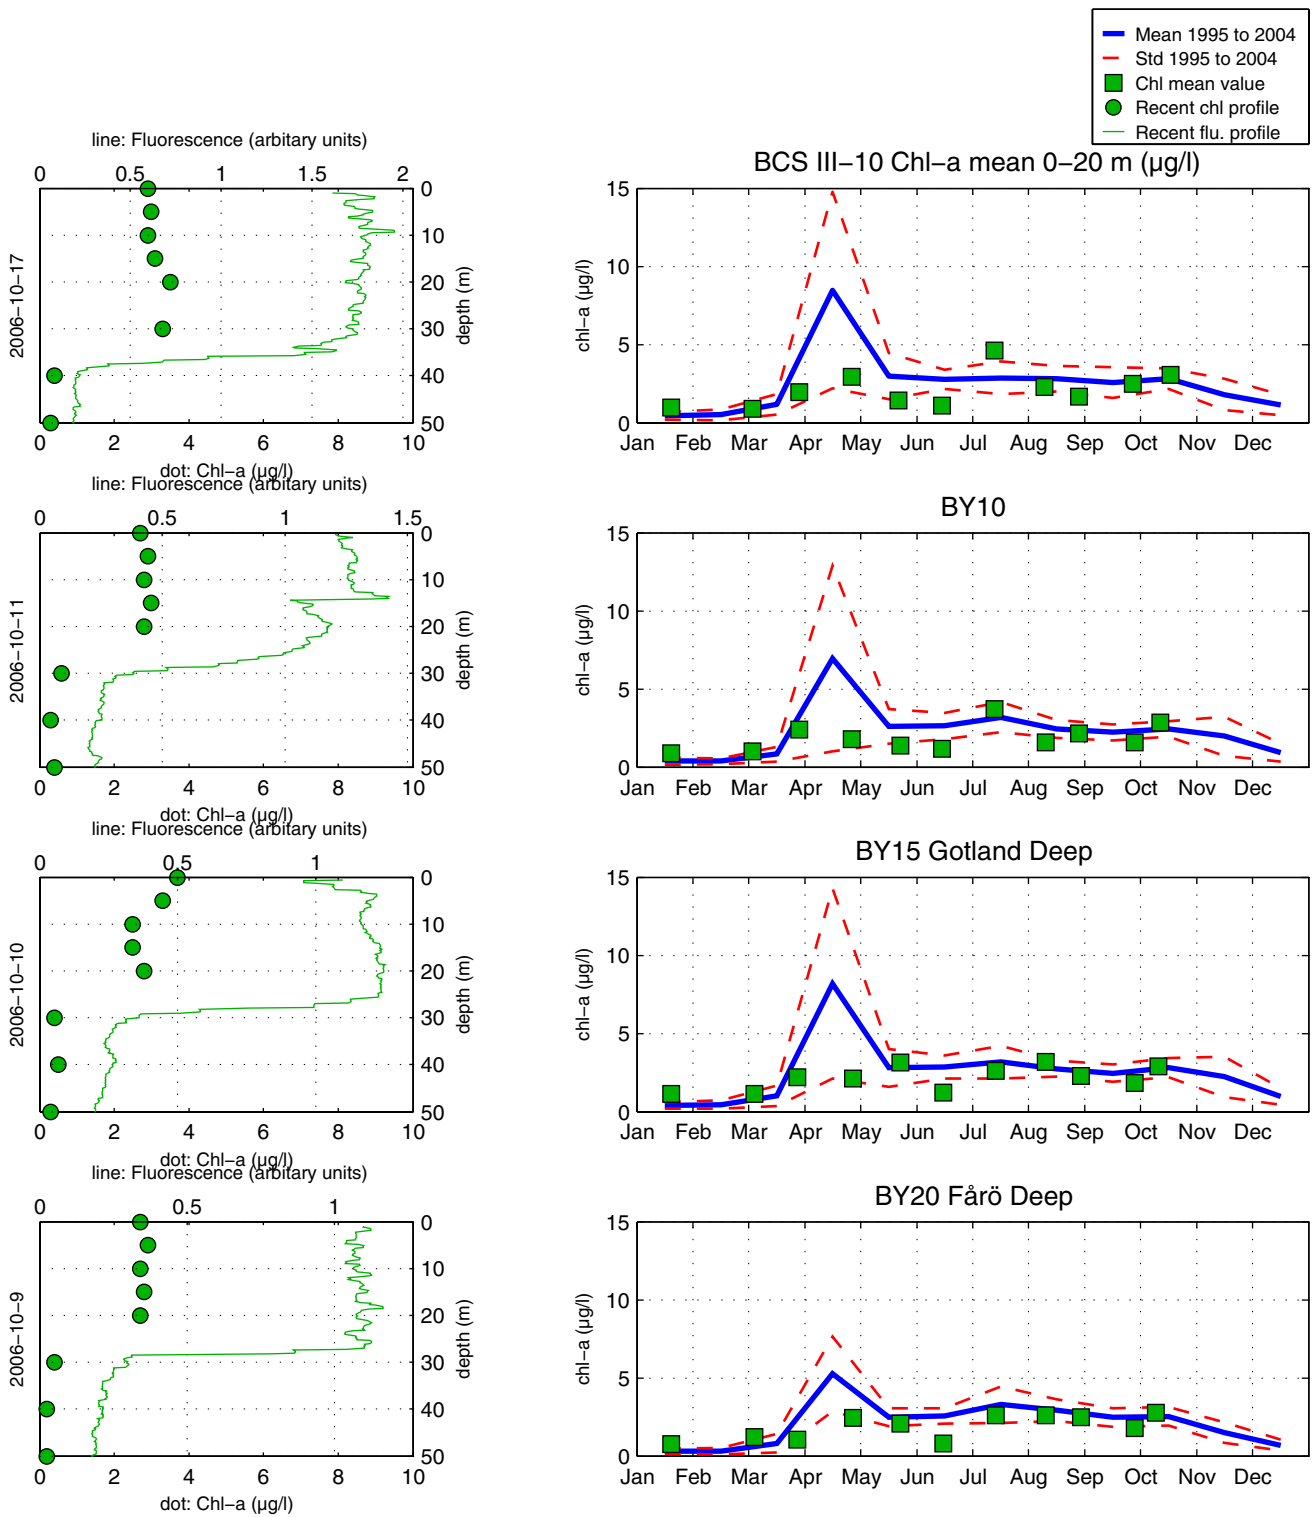

Chlorophyll *a* is sampled from several depths from the R/V Argos. Data is presented both from the discrete depths and as an average 0-20 m. In addition to the laboratory analysis from the water samples chlorophyll fluorescence is measured in continuous depth profiles from the ship. This is a way to observe thin layers of phytoplankton occurring below the surface.
